**Chincoteague Channel and Tom's Cove** Growing Area # 101 **Accomack County Shoreline Sanitary Survey** 

Date: 30 October 2020

**Survey Period:** November 6, 2019 – October 14, 2020

Total Number of Properties Surveyed and Near Shore Samples Collected: 205

Surveyed By: B.T. Charnock and R.C. Snead

## SECTION A: GENERAL

This survey area extends from Reference Point 99 at the south side of the west end of the bridge over Black Narrows on Route 175, continuing around the shoreline of all islands and land area east of this point in a counter clockwise direction continuing on the south side of route 2113 and south of a line drawn from the beginning of Route 2113 on Assateague Island east to the Atlantic Ocean to reference point 101 adjacent to the old Assateague Beach Coast Guard Station, including Black Narrows, Chincoteague Channel, The Canal, Chincoteague Inlet, Fowling Gut, Andrews Landing Gut, Black Point Drain, Assateague Channel, Sheepshead Creek, Smalley Drain, Black Duck Creek, Tom's Cove, Little Tom's Cove, Eel Creek, and all of their tributaries. Due to the number of dwellings in this area, this report encompasses only half of the Chincoteague and Assateague Islands – the remainder of the islands are surveyed under the designation Growing Area # 102 "Assateague Channel and Oyster Bay".

The topography in this area is generally low and marshy, with maximum elevations of 5' on Chincoteague Island and 10' on Assateague Island. Occasional flooding occurs in the low lying and poorly drained areas during storms and unusually high tides. During this survey period, frequency of ponding of storm water in residential areas was high. Chincoteague Island is densely populated with significant seasonal variation due to a large number of dwellings used as vacation homes. The population increases dramatically during the summer months, reaching peak levels during the July pony penning event. Conversely, Assateague Island is sparsely populated, as the majority of the land mass is occupied by the Assateague Island National Seashore Park. A high level of tourist traffic visits the park during summer months to access the beach and pony-viewing areas. While the economy of both islands is based primarily on tourism, Chincoteague has a growing shellfish aquaculture industry as well as other seafood harvesting and processing operations. Lot development and enhancement is continuous on Chincoteague; at the time of this writing.

Meteorological data indicated that the area received a total rainfall of 16.73" for the survey period. A monthly breakdown is as follows:

Nov 6-30, 2019	1.81"	December	2.32"	Jan. 2020	2.91"
February	4.92"	March	4.0"	April	3.95"
May	1.63"	June	1.51"	July	3.87"
August	7.04" (H. Laura 3.32")	September	4.05"	Oct. 1-14	1.77"

Sewage disposal systems serving residential and commercial properties on Chincoteague Island are cesspools, septic tanks with drain fields, or approved alternative systems, such as mounds and sand filtration systems. As cesspools age and experience increased seasonal demand, they are frequently being replaced with alternative systems that are better suited to low ground. Even so, a significant proportion of existing dwellings continue to rely on cesspools and drywells. Cesspools and septic tanks are periodically pumped by private contractors and the sludge removed to a mainland location (currently located in Maryland). Assateague Island uses portable and vault privies for its sewage disposal. There are nine sewage treatment facilities in this survey, serving Sunset Bay Village, the US Coast Guard Station, the Marina Bay Hotel, and several private residences using sand filtration systems.

Boating activity around Chincoteague Island is variably heavy, with maximum activity occurring during the summer months, especially when the pony herd is being swum across the Assateague Channel in July. Recreational boaters and commercial watermen alike make maximum use of the waters during the June-August time frame, with heavy concentrations of recreational boaters at the southeast tip of Chincoteague (including Chincoteague Channel and The Canal) and near Black Point in Assateague Channel.

Animal activity is unusually high on both islands. A herd of semi-wild ponies ranges free across Assateague Island, with the Virginia consisting of approximately 150 animals, impacts this survey. Assateague is also home to large populations of deer, waterfowl, and shorebirds. Domestic dogs are not allowed on the Virginia portion of Assateague Island. Chincoteague Island is home to a number of privately-owned horses and ponies, unusual for such a populated area, and a moderate influx of domestic dogs accompanies summer visitors. It is noteworthy that a large flock of semi-domesticated ducks and geese range free through the town, with groups of more than 50 not uncommon in certain yards. Feeding of the flock by local residents increases concentrations of bird waste in those areas, most notably along the Chincoteague Channel.

At the beginning of the survey, inspectors reviewed the available literature from prior reports, public works and online resources to characterize land use, drainage patterns, and to establish nearshore seawater stations. Properties identified in the previous survey as having sanitary deficiencies or other environmental significance were revisited to evaluate their classification status. All roadways and navigable shoreline within the survey boundary were visually inspected to identify potential pollution sources requiring further investigation.

Nearshore seawater stations were established to survey the full extent of waters beyond routine classification stations. Stations were created in closer proximity to the shoreline and farther upstream than routine stations and are intended to evaluate drainage entry points of potential pollution sources. Station data was analyzed and used to compare relative concentrations of fecal indicator bacteria within the waterway to identify potential onshore sources of contamination.

Copies of Bacteriological, Hydrographic, and Shellfish Closure data are available at the area office for review. Copies of the current condemnation notices and maps are available via the internet at www.vdh.virginia.gov/shellfish/.

Copies of Bacteriological and Shellfish Closure data are available at the area office for review. This report lists only those properties that have a sanitary deficiency or other environmental significance. "*DIRECT*" indicates that the significant activity or deficiency has a direct impact on shellfish waters. Data in this report are also made available to local health departments and other agencies to address items that may be out of compliance with their regulatory programs. Copies of VPDES Permits and inspections are available at the Department of Environmental Quality, Tidewater Regional Office (DEQ/TRO).

Maps of the Enterococcus sampling are shown at the conclusion of this report. Hydrographic data is shown in the table below.

	Area 101	Nearshore Samplin	ng	R	ainfall in Inc	hes
