Background

Lead poisoning is usually an asymptomatic disease; therefore blood lead testing needs to be performed based on risk and not just symptoms. Lead exposure can damage children's nervous, hematopoietic, and renal systems. It is especially harmful to the developing nervous systems of fetuses. There is no safe level for lead exposure.

Children under the age of three years (36 months) are at risk due to this age group's frequent hand-to-mouth activity and their developing neurological system. The main source of lead exposure for children in Virginia is house dust contaminated by leaded paint, and soil contaminated by decades of industrial and motor vehicle emissions (leaded gasoline). Although lead paint was banned from residential use in 1978, lead remains a hazard in homes built before the ban, especially pre-1950 housing. Renovation of these older homes can create additional lead hazards for families and workers. The pre-1978 homes of child care providers or daycare centers are also potential areas of exposure.

The primary phase-out of leaded gasoline was completed in 1986; however lead from this source still remains as a hazard because lead is not biodegradable. There are also other pathways to lead exposure from sources such as imported jewelry and toys, home health remedies, imported herbs and spices, imported vinyl mini blinds, and other vinyl products. Many of the imported vinyl products use lead as a stabilizer, and as the product deteriorates the lead becomes available.

Many hobbies or occupations can be considered hazardous activities regarding lead exposure; furniture refinishing and making stained glass are examples. Other activities that may be associated with lead exposure include: using indoor firing ranges; performing renovation, remodeling, and painting; working with lead batteries; performing auto paint refinishing; and making pottery. "Take-home" exposures may result when workers wear their work clothes home and/or wash them with the family laundry. Another take-home exposure may occur when scrap or waste material is brought home from work.

Lead dust in the home is usually a chronic exposure and therefore has more potential to cause permanent damage to the child. An occasional or acute exposure to a toy or similar object where the lead is not readily available to the child will most likely not cause any health problems.

The *Code of Virginia*, sections 32.1-46.1 requires all children determined to be at risk to be tested for elevated blood lead levels at the age of one year (12 months), again at the age of two years (24 months), and between the ages 36 - 72 months if never tested previously or are exposed to a new risk factor. All Medicaid enrolled children must be tested at age one year (12 months) and again at 2 years (24 months) regardless of any risk factors. This periodic testing is both a federal and state requirement. All laboratories are required to report blood lead results electronically within ten days. Lead poisoning is a reportable disease and completion of the Epi-1 form is required.

Mission

The mission of the Lead Safe Virginia Childhood Lead Poisoning Prevention Program is to eliminate lead as a health hazard for children less than six years of age by the year 2010.

Program Activities

The Lead-Safe Virginia Program is funded by the Centers for Disease Control and Prevention (CDC) and the Environmental Protection Agency (EPA).

The objectives of the Lead-Safe Virginia Program include 1) assure all at-risk children receive lead testing 2) coordinate care and referrals for medical and environmental intervention for all children under six years of age with an elevated blood lead level 3) educate the public and health care providers regarding childhood lead poisoning 4) educate realtors, landlords, renovators, painters, homeowners, and others regarding lead-safe work practices and EPA regulations 5) maintain a statewide childhood blood lead surveillance system 6) implement primary prevention measures to reduce children's exposure to lead hazards through activities and collaboration 7) coordinate the implementation and evaluation of the statewide lead elimination plan, *A Collaborative Strategic Plan to Eliminate Childhood Lead Poisoning in Virginia by 2010*.

2008 Data and Statistics

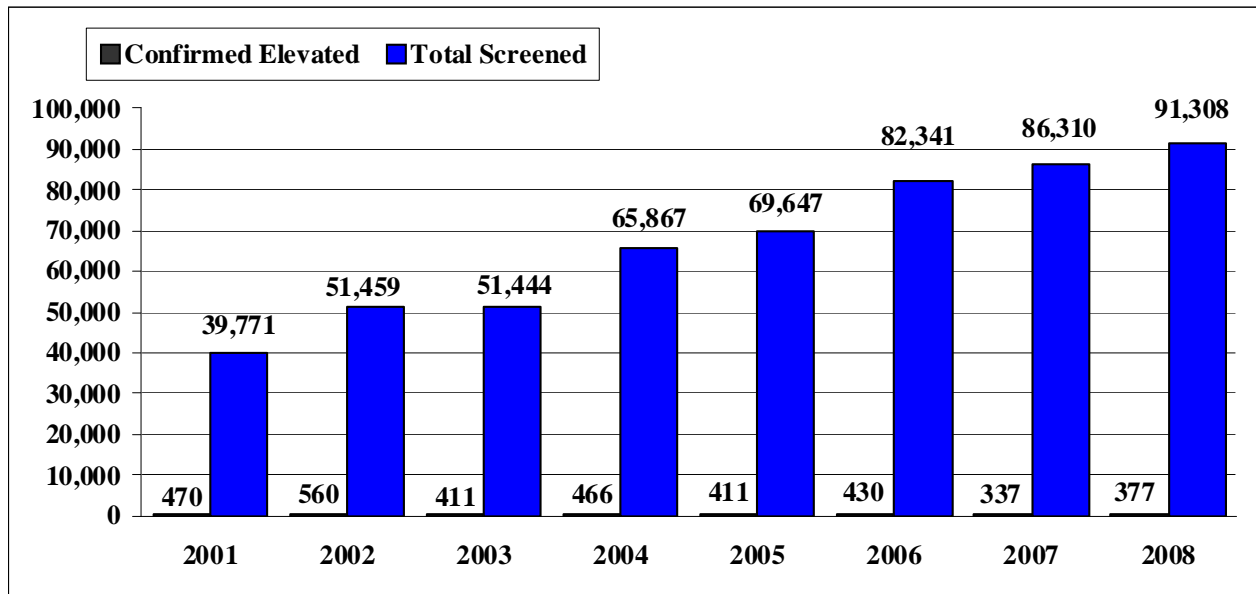

This report summarizes the 2008 data to include both testing and confirmed elevated blood lead level data, and the identification of sources of exposure for children under 6 years of age. A confirmed EBLL is defined as a single elevated venous test $\geq 10 \mu\text{g/dL}$ or two elevated capillary tests within 84 days/12 weeks and is only counted once in the year in which it initially occurred.

Testing for lead exposure is a key component of reducing childhood lead poisoning. Early detection of a child's elevated blood lead level (EBLL) provides the opportunity to identify and reduce lead hazards in order to lower the child's exposure and also identify and address hazards to prevent future cases. During 2008, 91,308 children under 6 years (72 months) of age were tested for lead exposure. Of these, 377 children were reported as having a confirmed elevated blood lead test. Of the high-risk age category, under 36 months, 54,634 were tested with 217 confirmed EBLLs. Medicaid enrolled children under 36 months of age accounted for 38.5% of the children tested in this high-risk age category, and 124 of those were confirmed EBLLs. This accounts for 57% of the confirmed EBLLs in this age category. See Figure 3 for Medicaid data results for 2001-2008. The CDC has determined that children enrolled in Medicaid are at high-risk for lead exposure for various reasons. The program is working with the Department of Medical Assistance Services to educate providers regarding the federal and state requirement to test Medicaid enrolled children at both 12 and 24 months of age. The adoption by the National Committee for Quality Assurance (NCQA) through the Healthcare Effectiveness Data and Information Set (HEDIS) a measure for lead testing should help with provider compliance.

There has been a steady increase in the number of children tested for EBLLs between 2001 and 2008. (Figure 1) This increase can be partially attributed to the testing and reporting requirements of 12 VAC 5-120, "Regulations for testing children for elevated blood lead levels", made effective July 1, 2001. These regulations were amended to include CLIA-waived point of care providers in the definition of a laboratory and allowing the use a CLIA-waived, CDC approved lead testing device. Providers are now required to provide lead poisoning prevention materials at all well-child physicals on children under 72 months of age.

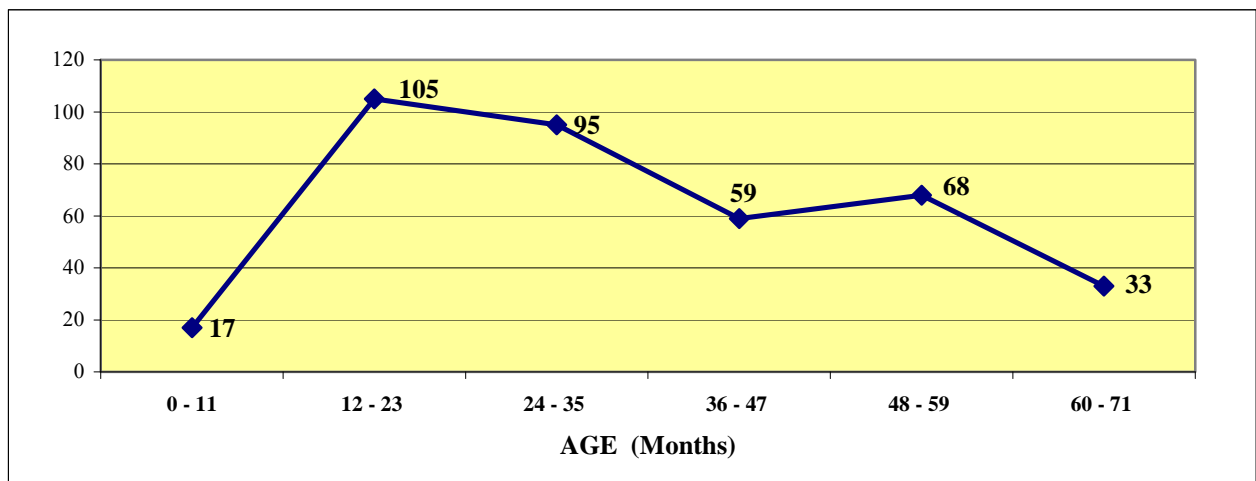

Primary prevention is necessary to eliminate lead as a health hazard for children. The Lead-Safe Virginia Program collaborates with local, state, and federal agencies to reduce lead hazards before children become lead poisoned.

Figure 1. Statewide Testing Results for Virginia Children < 72 months, 2001-2008

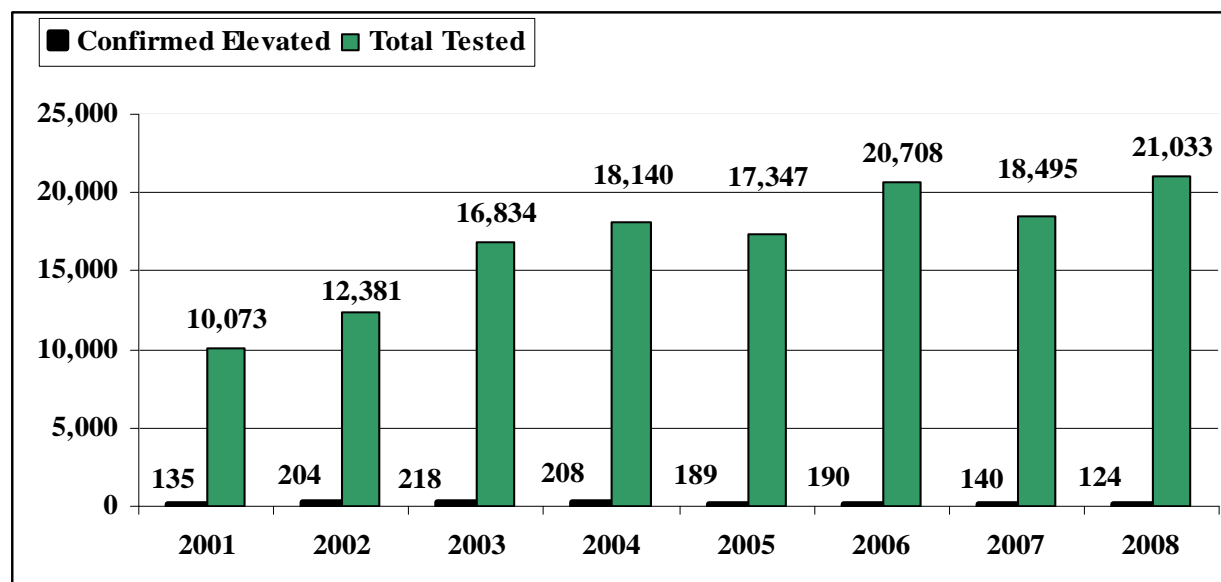

Note: Results based on one test per child per year. The reporting of elevated blood lead levels is required under the Regulations for Disease Reporting and Control. Effective July 1, 2001, regulations require the reporting of all lead tests performed on children under 72 months of age. The number of children tested each year is influenced by several factors that include the number of children born in Virginia each year, migration of children into and out of the state or to a different locality, and the number of children tested in compliance with the regulations. These statistics are preliminary, as the database will accept historical data as made available and continuous data quality control may depict minor changes.

Figure 2. Number of children < 72 months of age with reported confirmed elevated blood lead levels $\geq 10 \mu\text{g/dL}$, by age category: Virginia, 2008

Note: A 'confirmed' elevated blood lead level (EBLL) is defined as a single elevated venous test $\geq 10 \mu\text{g/dL}$ or two elevated capillary tests within 84 days/12 weeks and is only counted once in the year in which it initially occurred. The reporting of elevated blood lead levels is required under the Regulations for Disease Reporting and Control. Effective July 1, 2001, regulations require the reporting of all blood lead tests performed on children under 72 months of age. These statistics are preliminary, as the database will accept historical data as made available and continuous data quality control may depict minor changes.

Figure 3. Statewide Testing Results for Medicaid Enrolled Children < 36 months of Age, 2001-2008

Note: A 'confirmed' elevated blood lead level (EBLL) is defined as a single elevated venous test ≥ 10 $\mu\text{g/dL}$ or two elevated capillary tests within 84 days/12 weeks and is only counted once in the year in which it initially occurred. The reporting of elevated blood lead levels is required under the Regulations for Disease Reporting and Control. Effective July 1, 2001, regulations require the reporting of all blood lead tests performed on children under 72 months of age. These statistics are preliminary, as the database will accept historical data as made available and continuous data quality control may depict minor changes. Additional data are obtained through data matching with the state Medicaid agency (DMAS).

Table 1. Number of children confirmed for lead exposure, by age category, by blood lead level: Virginia, 2001 – 2008

	10 - 14 $\mu\text{g/dL}$	15 - 19 $\mu\text{g/dL}$	20 - 44 $\mu\text{g/dL}$	45 - 69 $\mu\text{g/dL}$	≥ 70 $\mu\text{g/dL}$	Total
< 36 Months of Age						
2001	102	39	35	2	0	178
2002	176	59	51	5	0	291
2003	163	52	41	2	1	259
2004	186	44	42	6	0	278
2005	169	48	28	3	0	242
2006	175	38	35	2	0	252
2007	132	52	32	1	0	217
2008	140	47	29	1	0	217
< 72 Months of Age						
2001	138	65	51	3	0	257
2002	236	84	63	7	0	390
2003	242	72	60	3	3	379
2004	317	69	66	6	2	460
2005	287	70	47	6	1	404
2007	223	70	52	1	0	346
2006	299	58	67	6	0	432
2007	216	68	52	1	0	337
2008	237	79	58	3	0	377

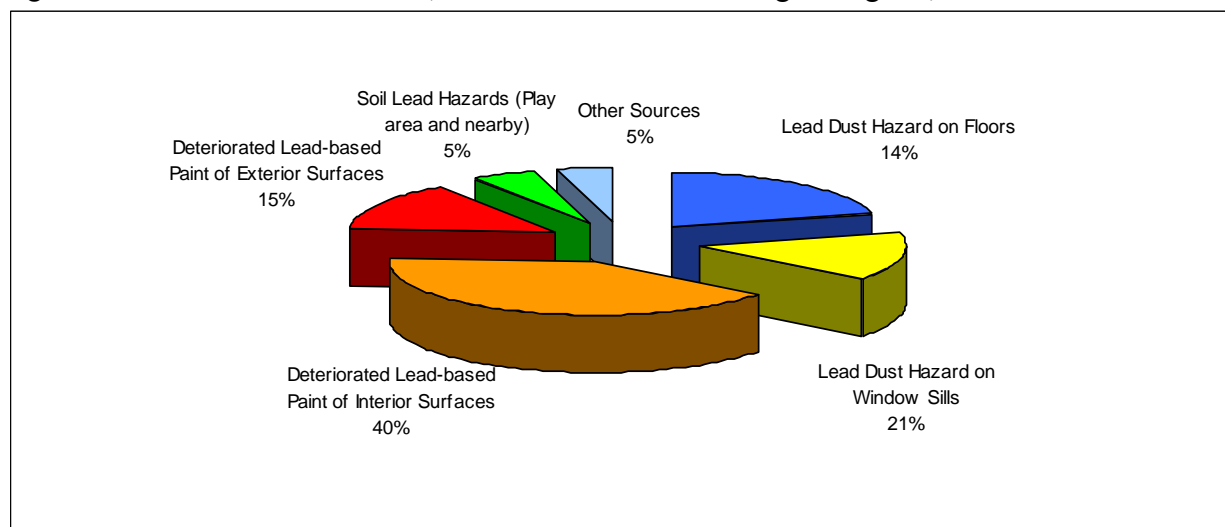

Note: A 'confirmed' elevated blood lead level (EBLL) is defined as a single elevated venous test ≥ 10 $\mu\text{g/dL}$ or two elevated capillary tests within 84 days/12 weeks and is only counted once in the year in which it initially occurred. The reporting of elevated blood lead levels is required under the Regulations for Disease Reporting and Control. Effective July 1, 2001, regulations require the reporting of all blood lead tests performed on children under 72 months of age. The number of children tested each year is influenced by several factors that include the number of children born in Virginia each year, migration of children into and out of the state or to a different locality, and the number of children tested in compliance with the regulations. These statistics are preliminary, as the database will accept historical data as made available and continuous data quality control may depict minor changes.

Table 2. Summary of environmental investigations, children < 72 months of age: Virginia, 2008

Number of EBLLs 20 µg/dl or above	61
Number of EBLLs persistent 15-19µg/dl	25
Number of environmental intervention blood lead investigations (EIBLI) required	66
Number of environmental investigations performed (<i>Includes secondary addresses</i>)	120
Number of EIBLI not performed (5-refused services, 2-moved out of state, 1 referred to DHCD)	8
Number of “newcomer/refugee” children with EBLL requiring EIBLI	11
Lead dust hazard on floors	108
Lead dust hazard on window sills	157
Deteriorated lead based paint on exterior surfaces	109
Deteriorated lead based paint on interior surfaces	301
Soil lead hazards identified (children’s play area)	20
Soil lead hazards identified (non play areas)	16
Lead in water above 15 ppb (private wells-3; plumbing -5)	8
Occupational exposure from parent (construction worker)	1
Mini blinds	7
Home/folk remedies (kohl, eye-liner from Morocco)	4
Furniture (1-bookcase, 3-bathtub glaze, 4-radiator, 1-bird bath)	9
Toys (matchbox car)	1
Consignment shop (beaded homemade bracelet)	1
Bullet (oral)	1
Clothing (zipper on a sweatshirt)	1
Reported exposure from renovation activities	1

Note: Environmental intervention blood lead investigations are performed on all confirmed venous elevated blood lead levels ≥ 20 µg/dL or persistent confirmed blood lead levels of 15 to 19 µg/dL on children < 72 months of age. Environmental investigations / risk assessments not conducted or completed were due to varying reasons such as the family moved to a new address or the family refused inspection. Multiple environmental investigations may be required for the same child due to the possibility of lead exposure from more than one location.

Note: 2000 U.S. Census Population Data were used. Results based on one test per child per year. A confirmed elevated blood lead level (EBLL) is defined as a single elevated venous test ≥ 10 µg/dL or two elevated capillary tests within 84 days/12 weeks and is only counted once in the year in which it initially occurred. The reporting of elevated blood lead levels is required under the Regulations for Disease Reporting and Control. Effective July 1, 2001, regulations require the reporting of all lead tests performed on children under 72 months of age. The number of children tested each year is influenced by several factors that include the number of children born in Virginia each year, migration of children into and out of the state or to a different locality, and the number of children tested in compliance with the regulations. ^Regulations only require testing at 1 and 2 years of age if determined to be at risk. These statistics are preliminary, as the database will accept historical data as made available and continuous data quality control may depict minor changes in data. * Unknown addresses are due to providers not submitting a child's address with the laboratory lead test request, or in some cases, the laboratory not forwarding this information as required.

INCIDENCE

VIRGINIA, CHILDREN UNDER 6 YEARS OF AGE,
2008 REPORTED ELEVATED BLOOD LEAD LEVELS

Guidelines for Childhood Lead Poisoning Testing

ALL MEDICAID ENROLLED CHILDREN ARE REQUIRED TO BE TESTED AT 1 AND 2 YEARS OF AGE

To determine risk for other children, please use the chart below.

OTHER RISK FACTORS FOR CHILDREN

Blood lead levels shall be obtained in children at ages 1 and 2 if they meet ANY one of the criteria noted in the box below. In addition, children ages 3-5 years of age who have not previously been tested, and moved to a new address in a high-risk area, or meet ANY one of the criteria in the box below shall also be tested.

- | | |
|----|---|
| 1. | Eligible for or receiving WIC benefits? Medicaid eligible and not tested at both 1 and 2 years of age? |
| 2. | Living in a ZIP Code determined to be high-risk based on age of housing and other factors? (See attached High – Risk ZIP Code list) |
| 3. | Living in or regularly visiting a house or day care center built before 1950? |
| 4. | Living in or regularly visiting a house built before 1978 with peeling or chipping paint or recent (within the last 6 months), ongoing or planned renovation? |
| 5. | Living with or regularly visiting a sibling, housemate or playmate with lead poisoning? |
| 6. | Living with an adult whose job or hobby involves exposure to lead? |
| 7. | Living near an active lead smelter, battery recycling plant, or other industry likely to release lead? |
| 8. | Recent refugee, immigrant, or child adopted from outside of the U.S. |

- Take careful history regarding possible lead exposure at each routine visit.
- A child must be tested if the parent or guardian requests testing due to possible exposure (12 VAC 5-120).
- Testing may be performed by venipuncture or capillary. Filter paper methods are also acceptable and often more convenient for the family if performed in the provider's office. The use of a CLIA-waived lead testing device must be approved through the Lead-Safe Virginia Program at 804-864-7694 to assure proper quality assurance and reporting of data.

CONFIRMATION OF TESTING RESULTS

If result of capillary Testing test (µg/dL) is:	Perform diagnostic test on venous blood <u>within</u> :
10-19 [^]	Repeat blood test within 30 days to assure lead level is not rising Before 3 months
20-44	7-30 days (The higher the screen, the sooner the diagnostic test should be performed.)
45-59	48 hours
60-69	24 hours
≥70	Immediately as an emergency lab test

Note: Confirm elevated capillary blood lead levels ≥ 10 µg/dL. A 'confirmed' elevated blood lead level (EBLL) is defined as a single elevated venous test ≥ 10 µg/dL or two elevated capillary tests within 84 days/12 weeks. A venous sample is required for environmental investigations. Virginia regulations require reporting of blood lead levels ≥ 10 µg/dL (using the EPI-1 form) to the Office of Epidemiology. Regulations 12 VAC 5-120 require laboratories and point of care providers using CLIA-waived devices to report all blood lead tests on children under the age of six within ten days of analysis.

MANAGEMENT OF CHILDREN WITH CONFIRMED ELEVATED BLOOD LEAD LEVELS

BLOOD LEAD LEVEL (µg/dL)	ACTION (Case manager assures coordinated action and follow-up)	TIME FRAME (Begin intervention)
10-14	<ul style="list-style-type: none"> • Provide caregiver lead education: dietary and environmental • Follow-up blood lead testing within 30 days to assure not rising • Refer for WIC and social services, if needed 	Within 30 days
15-19	<ul style="list-style-type: none"> • Above actions, plus: • Proceed according to actions for 20-40 ug/dL if: A follow-up blood lead is 15 or above, or the blood lead level is increasing 	Within 2 weeks
20-44	<ul style="list-style-type: none"> • Above actions, plus: • Provide coordination of care (case management) • Provide environmental investigation and control lead hazards 	Within 1 week
45-69	<ul style="list-style-type: none"> • Above actions 	Within 48 hours
70 and above	<ul style="list-style-type: none"> • Above actions, plus: • Hospitalize child and begin medical treatment (chelation therapy as appropriate) immediately. • Contact Emergency Lead Healthcare line below. 	Within 24 hours

Current CDC management recommendations adapted from *Managing Elevated Blood Lead Levels Among Young Children: Recommendations from the Advisory Committee on Childhood Lead Poisoning Prevention*. (CDC, 2002).

* Investigations may be required where babies or multiple children in a household have elevated blood lead levels. Follow –up care is described in more detail in the VDH “Care Coordination Manual: Children with Lead Poisoning in Virginia”.
