

*Types of Teeth **

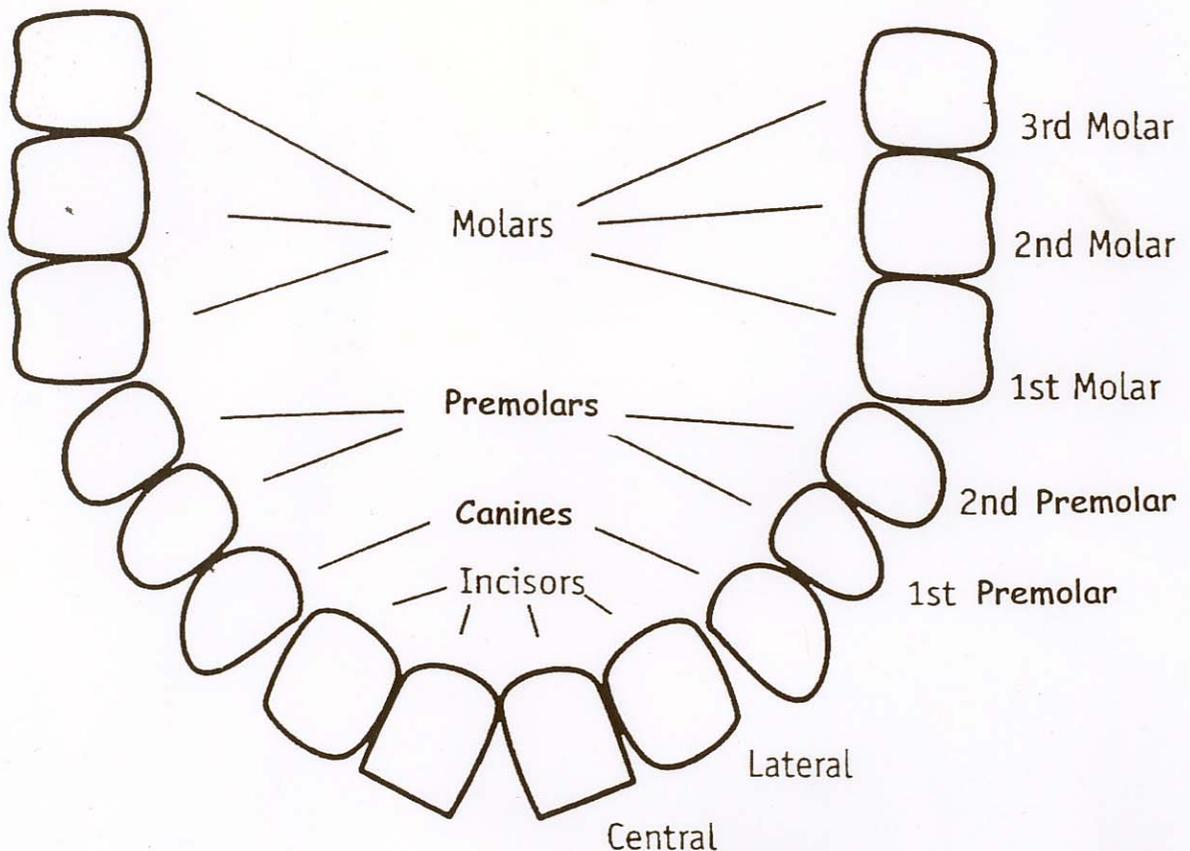

There are four kinds of teeth in our mouth
And they have different jobs when you are eating.

Incisors These teeth are in the front of the mouth, closest to the lips.
They bite into the food and cut it.

Canines Located next to the incisors, these teeth rip and tear up food.

Premolars These teeth grind the food.

Molars These teeth are in the back of the mouth, closest to the throat. They grind and crush the food.

* Primary sets of teeth include only incisors, canines and molars.
