

# ACLS - The Pharmacology

A non-sanctioned, non-sponsored,  
non-official discussion of  
medications used in EMS delivery  
of Advanced Cardiac Life Support.

# Background and Purpose

---

- The standardized approach of ACLS video supplemented classes reduced the ability to tailor information to the audience
- Students dealing with ACLS angst aren't the most receptive audience to anything else
- Memorization will get us through 16 hrs, but it has a tendency of failing at the fairly inopportune times

# Objectives

---

- Refresh knowledge of ACLS medications
- Discuss some of the changes
- Increase awareness of available, less used medication
- Discuss some of the evidence

# Common Sense Flow Chart

# Cardiac Arrest Pharmacology

---

“The primary goal of pharmacologic therapy during cardiac arrest is to facilitate restoration and maintenance of a perfusing spontaneous rhythm”

Neumar et al. Part 8. *Circulation*. 2010: S743

# Chain of Survival

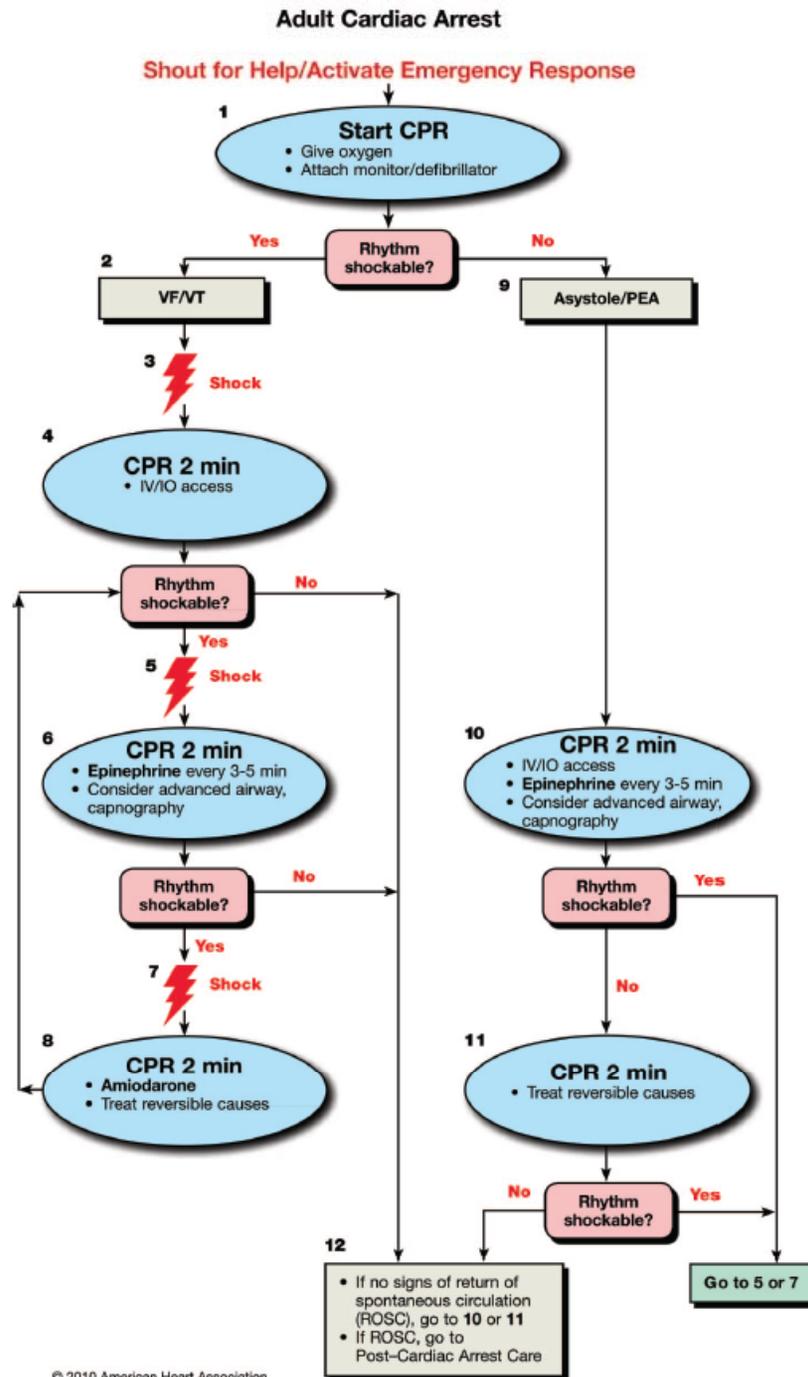

---

- Immediate recognition of cardiac arrest and activation of the emergency response system
- Early CPR that emphasizes chest compressions
- Rapid defibrillation if indicated
- Effective advanced life support
- Integrated post-cardiac arrest care

Effective implementation of the links of the chain can result in survival rates of witnessed out-of-hospital VF arrest approaching 50%

Rea TD et al. Increasing use of cardiopulmonary resuscitation during out-of-hospital ventricular fibrillation arrest: survival implications of guideline changes. *Circulation*. 2006; 114:2760-2765

(As cited in *Circulation*. 2010; 122(suppl 3): S685.)

© 2010 American Heart Association

#### CPR Quality

- Push hard (≥2 inches [5 cm]) and fast (≥100/min) and allow complete chest recoil
- Minimize interruptions in compressions
- Avoid excessive ventilation
- Rotate compressor every 2 minutes
- If no advanced airway, 30:2 compression-ventilation ratio
- Quantitative waveform capnography
  - If PETCO<sub>2</sub> <10 mm Hg, attempt to improve CPR quality
- Intra-arterial pressure
  - If relaxation phase (diastolic) pressure <20 mm Hg, attempt to improve CPR quality

#### Return of Spontaneous Circulation (ROSC)

- Pulse and blood pressure
- Abrupt sustained increase in PETCO<sub>2</sub> (typically ≥40 mm Hg)
- Spontaneous arterial pressure waves with intra-arterial monitoring

#### Shock Energy

- **Biphasic:** Manufacturer recommendation (eg, initial dose of 120-200 J); if unknown, use maximum available. Second and subsequent doses should be equivalent, and higher doses may be considered.
- **Monophasic:** 360 J

#### Drug Therapy

- **Epinephrine IV/IO Dose:** 1 mg every 3-5 minutes
- **Vasopressin IV/IO Dose:** 40 units can replace first or second dose of epinephrine
- **Amiodarone IV/IO Dose:** First dose: 300 mg bolus. Second dose: 150 mg.

#### Advanced Airway

- Supraglottic advanced airway or endotracheal intubation
- Waveform capnography to confirm and monitor ET tube placement
- 8-10 breaths per minute with continuous chest compressions

#### Reversible Causes

- Hypovolemia
- Hypoxia
- Hydrogen ion (acidosis)
- Hypo-/hyperkalemia
- Hypothermia
- Tension pneumothorax
- Tamponade, cardiac
- Toxins
- Thrombosis, pulmonary
- Thrombosis, coronary

Figure 1. ACLS Cardiac Arrest Algorithm.

# Asystole/PEA

---

- Epinephrine – 1 mg
  - Repeat every 3-5 minutes
- Vasopressin – 40 Units
  - May replace 1<sup>st</sup> or 2<sup>nd</sup> dose of epi
- Remember when?
  - Sodium Bicarb
  - Atropine

# Vasopressors

---

# Vasopressors

---

## Epinephrine

- What is it?

  - A) Catecholamine

  - B) Sympathomimetic

  - C) Adrenergic Receptor Agonist

- Can you still name the receptors we are looking to activate in arrest? (bonus for the biologic effect they cause)

# Vasopressors

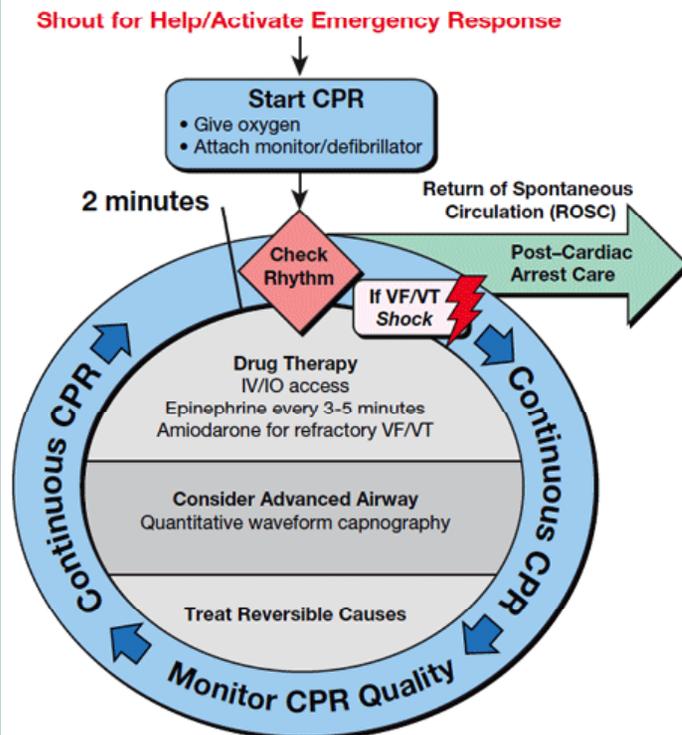

---

## Epinephrine

- So when are you giving the 1 mg?
  - Is this important?

# Vasopressors

**Figure 4**  
Circular ACLS Algorithm

The 'circular algorithm' introduced to emphasize the importance of CPR

“There is insufficient evidence to recommend a specific timing or sequence of drug administration and advanced airway placement during cardiac arrest.”

Neumar et al. Part 8. *Circulation*. 2010: S737

# Vasopressors

---

## Epinephrine

- So when are you giving the 1 mg?
  - Is this important?
- The half-life of catecholamines are measured are minutes (2ish)

# Is timing important?

---

- Maybe
- Part of why the endotracheal route was de-emphasized
  - Drug Concentration
  - Predictability of delivery and effect

Neumar et al. Part 8. *Circulation*. 2010: S743

# Vasopressors

---

## Vasopressin

- What is it?

- A Peptide Hormone
- Responsible for regulating water retention by controlling reabsorption in the tubules of the kidneys
- Increases PVR
  - Causing B/P increase

# Vasopressors

---

## Vasopressin

- How is it different from Epinephrine?
  - Specificity
    - We know how Epi affects cardiac muscle
    - Desirable effects of increased PVR without acting on non-specific adrenergic receptors
  - Half life
- So why just consideration

# VF/Pulseless VT

---

- Vasopressor

- Anti-Arrhythmic

- Amiodarone 300 mg
  - Second dose of 150 mg

Or

- Lidocaine 1-1.5 mg/kg
  - Additional dosing 0.5 – 0.75 mg/kg every 5-10 min. to a max of 3 mg/kg

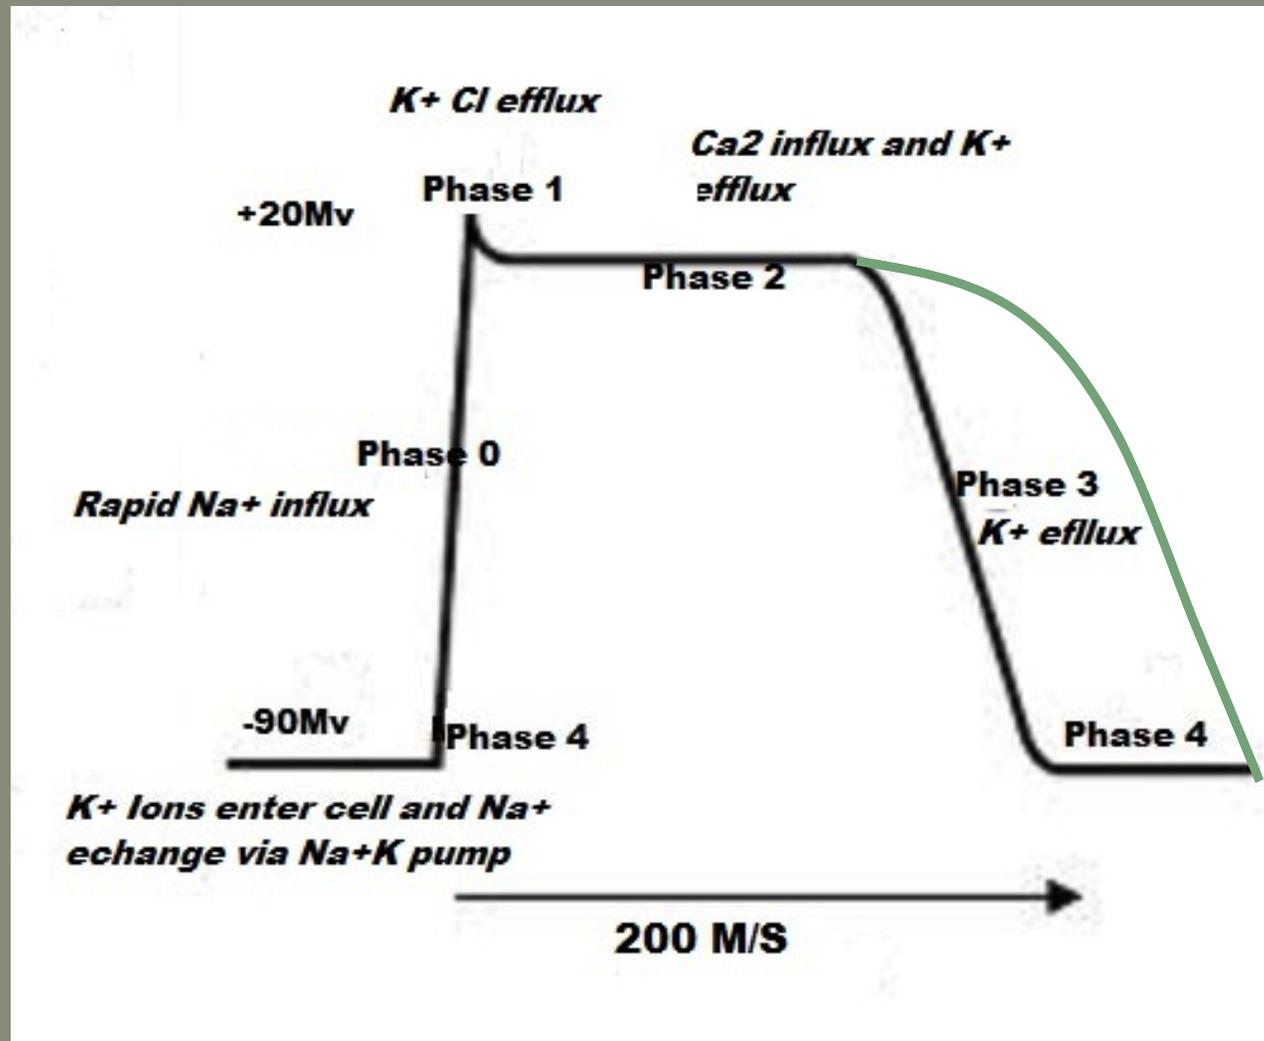

# Antiarrhythmics

---

## Amiodarone

- Class III antiarrhythmic agent
  - Prolongs phase 3 (repolarization) of the cardiac action potential

# Remember this?

# Antiarrhythmics

---

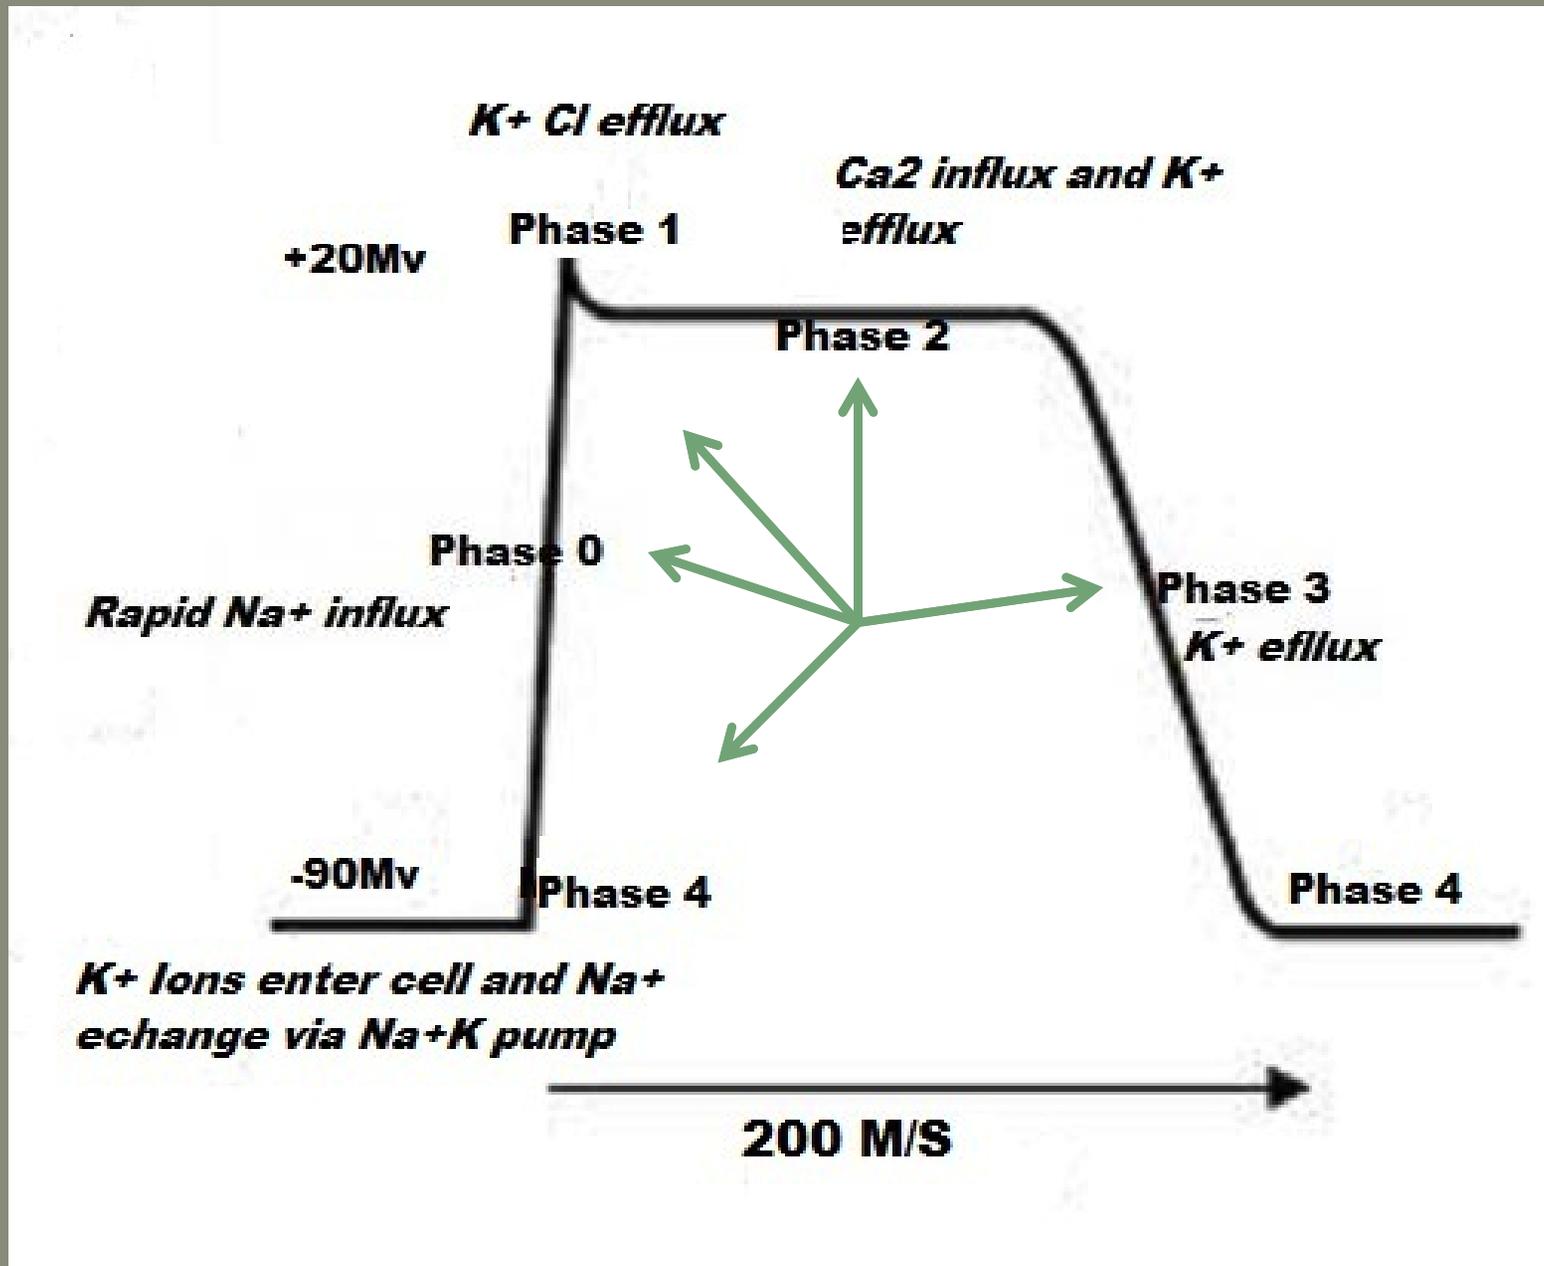

## Amiodarone

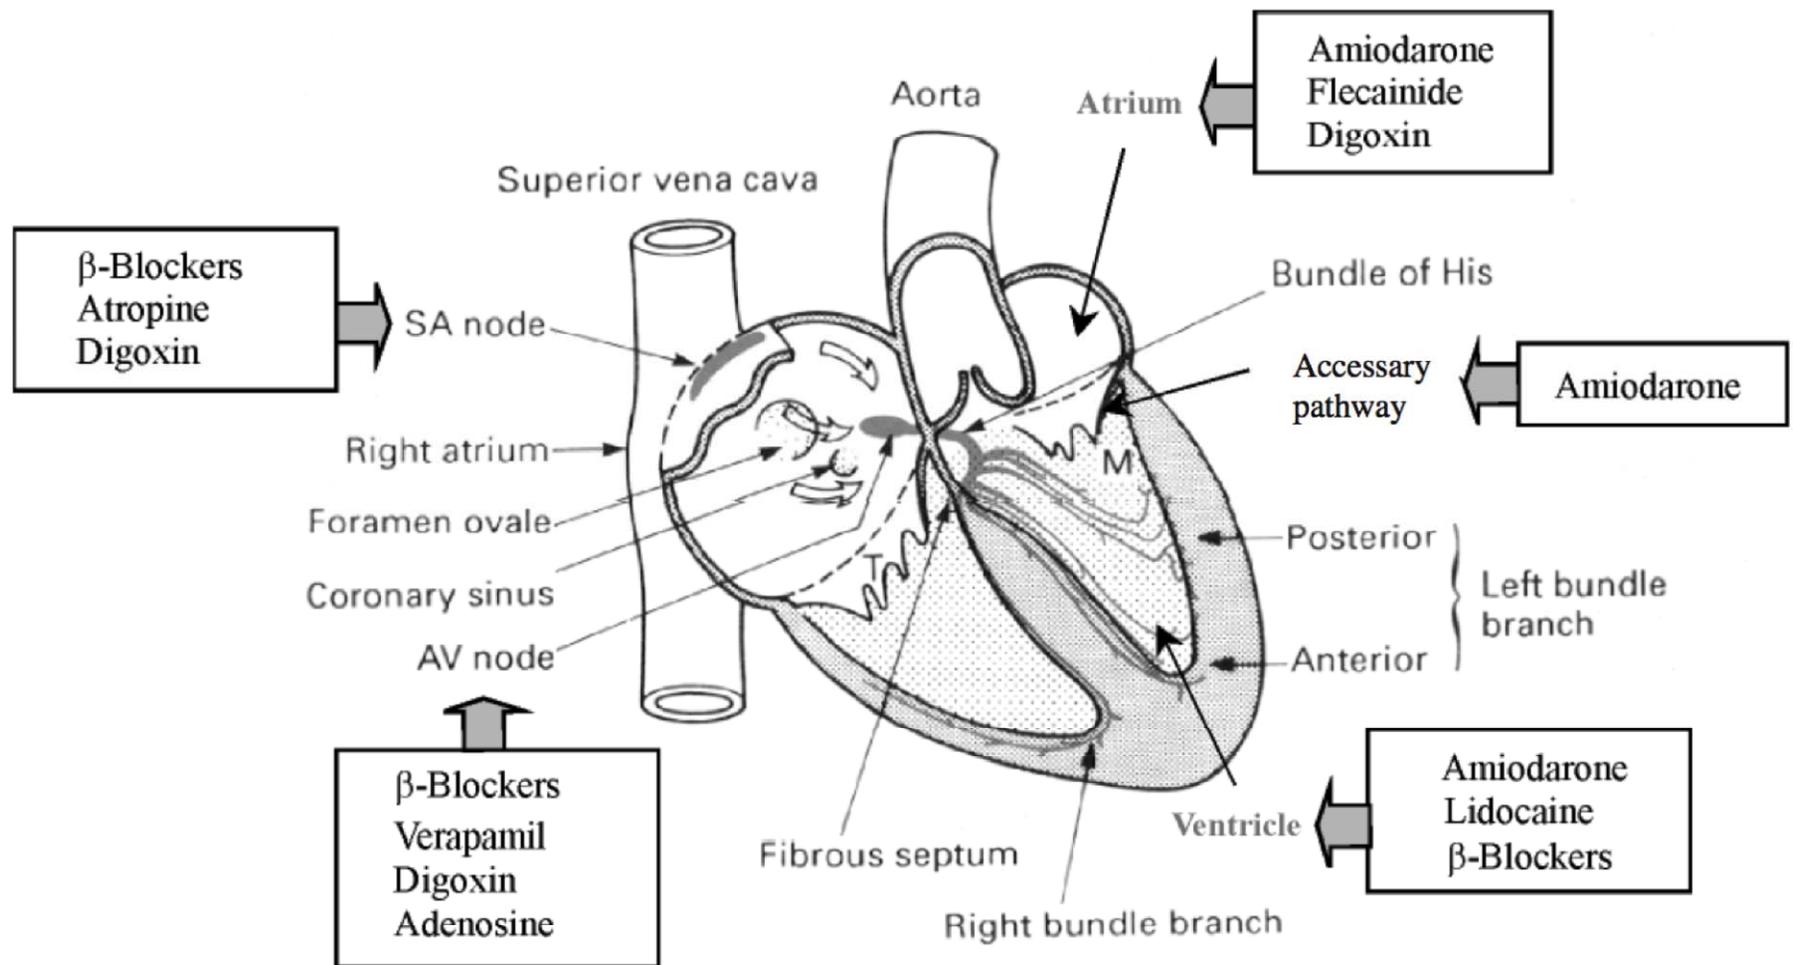

- Class III antiarrhythmic agent

- Prolongs phase 3 (repolarization) of the cardiac action potential
- Potassium Channel Blocker

And...

- It has effects similar to class Ia
- II
- IV

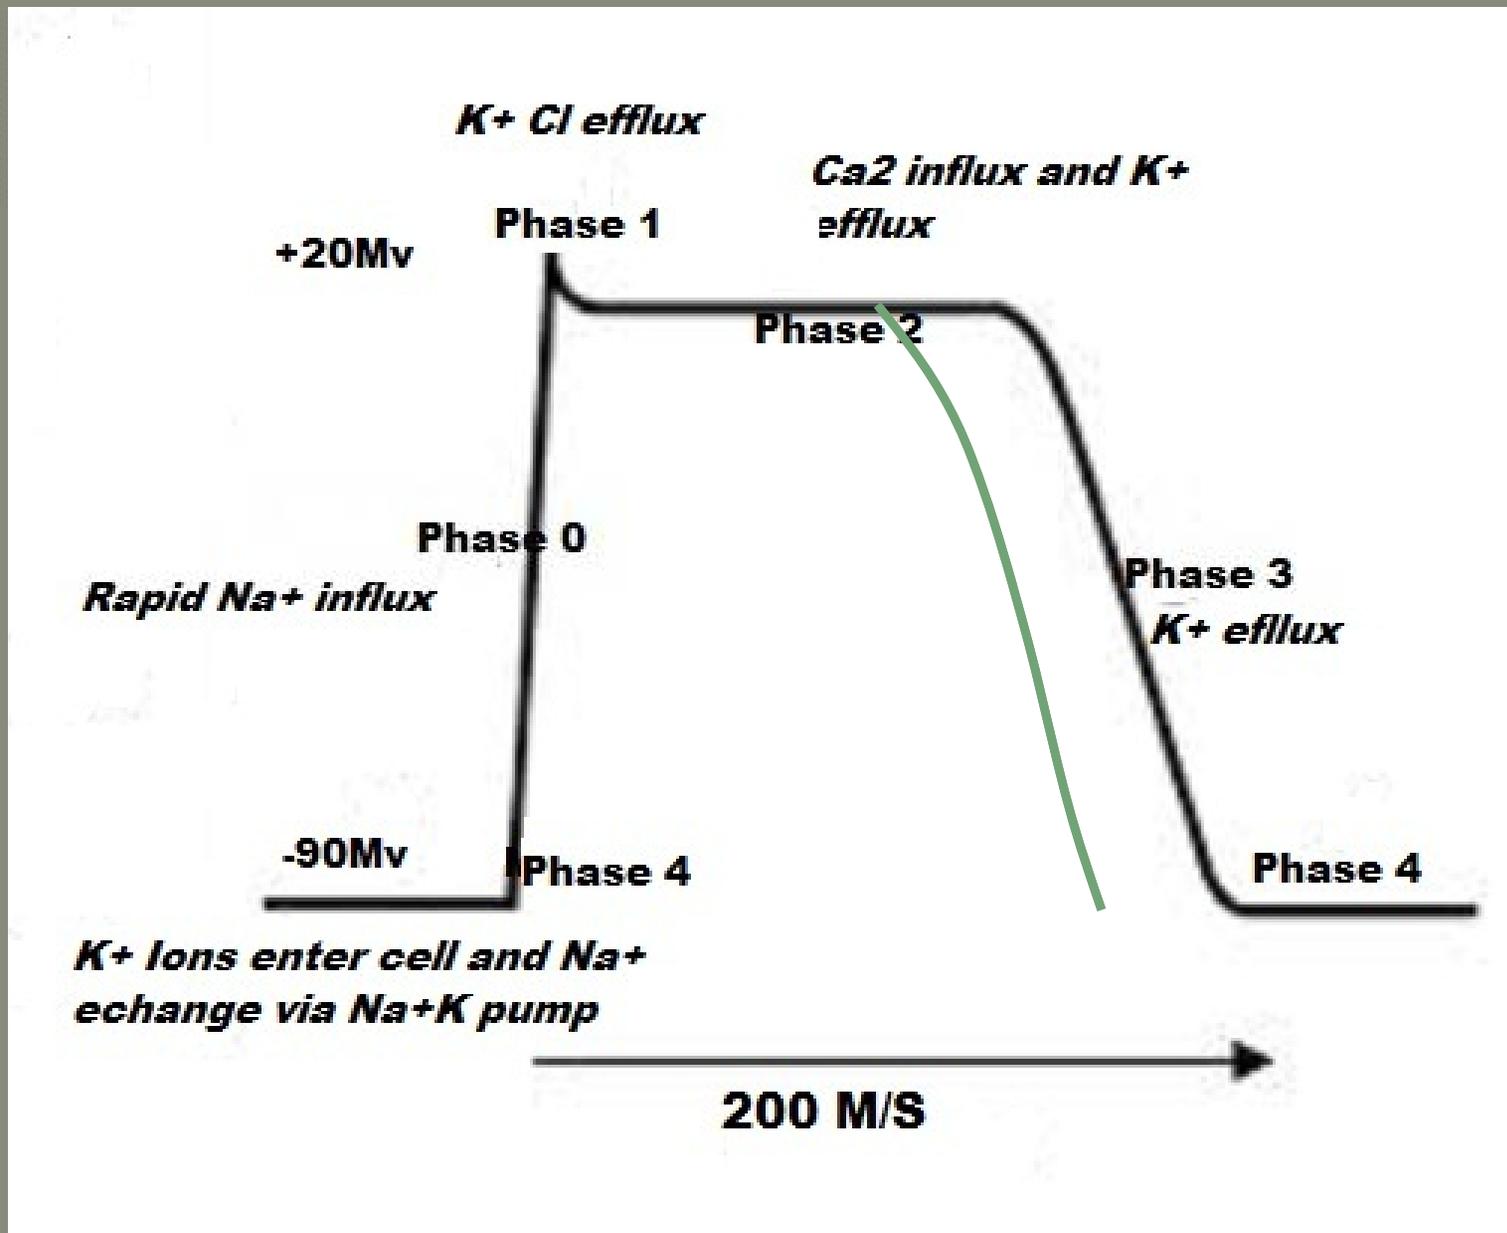

# Antiarrhythmics

---

## Lidocaine

- How does it 'anti' the arrhythmia?

# Antiarrhythmics

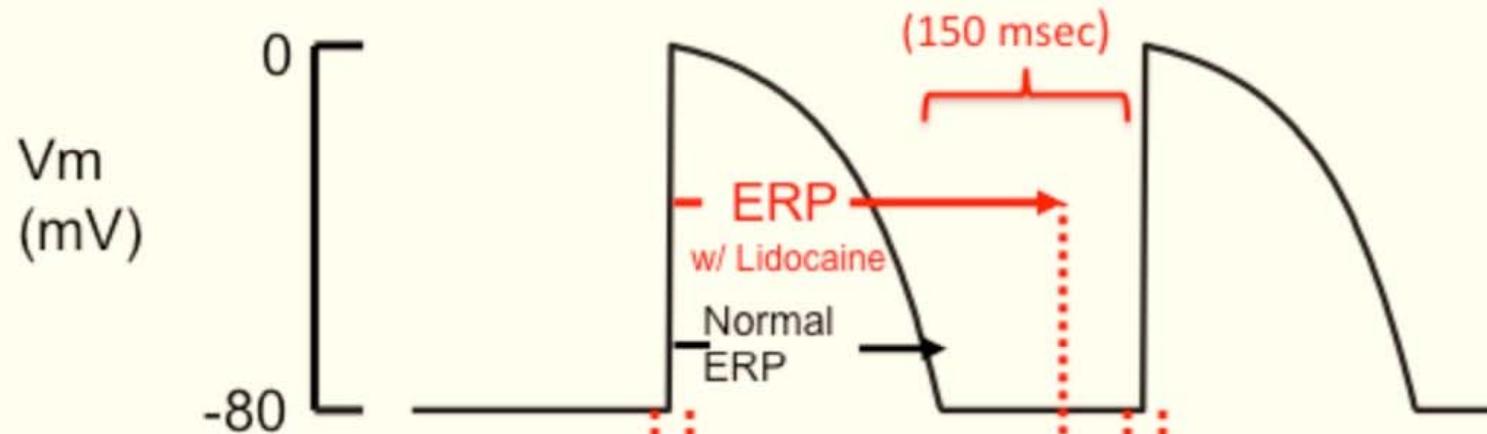

---

## Lidocaine

- How does it 'anti' the arrhythmia?
  - Class Ib
  - Na<sup>+</sup> Channel Blocking
  - Ventricular arrhythmias only?

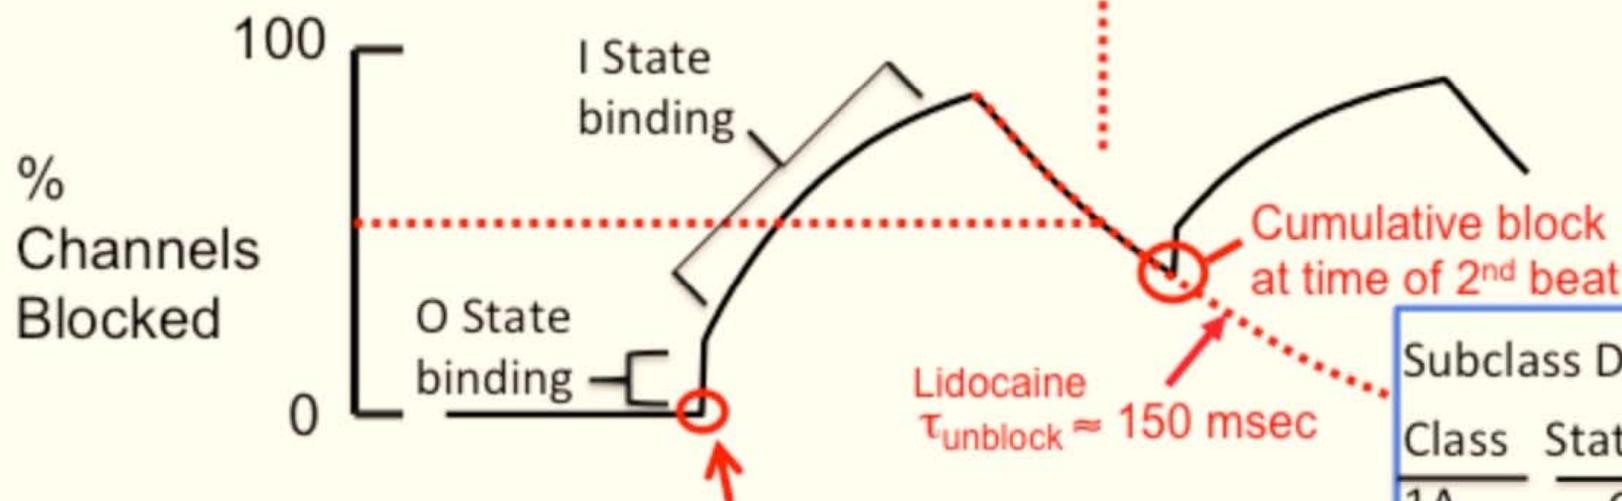

# Class I - State Dependent Block & the ERP

Example: 2<sup>nd</sup> beat occurs after a very short diastolic interval (150 msec)

Na Channel State:

R → O → I → R → O → I → R

Lidocaine 10  $\mu$ M

0% block remaining after a normal diastolic interval (no  $\Delta$  QRS)

Subclass Differences

Class	State Binding	$\tau_{\text{unblock}}$
1A	O > I	secs
1B	I >> O	< 1 sec
1C	O	>10 secs

# Antiarrhythmics

---

## ● Amio vs. Lido

- Is anyone using Lidocaine?
- What the Amiodarone studies say
- What the Lidocaine studies say

# What did we miss in CA?

---

## Magnesium Sulfate

- Electrolyte
- Indications
  - TdP
- Mechanism of Action
- Evidence?

# What (else) did we miss in CA?

---

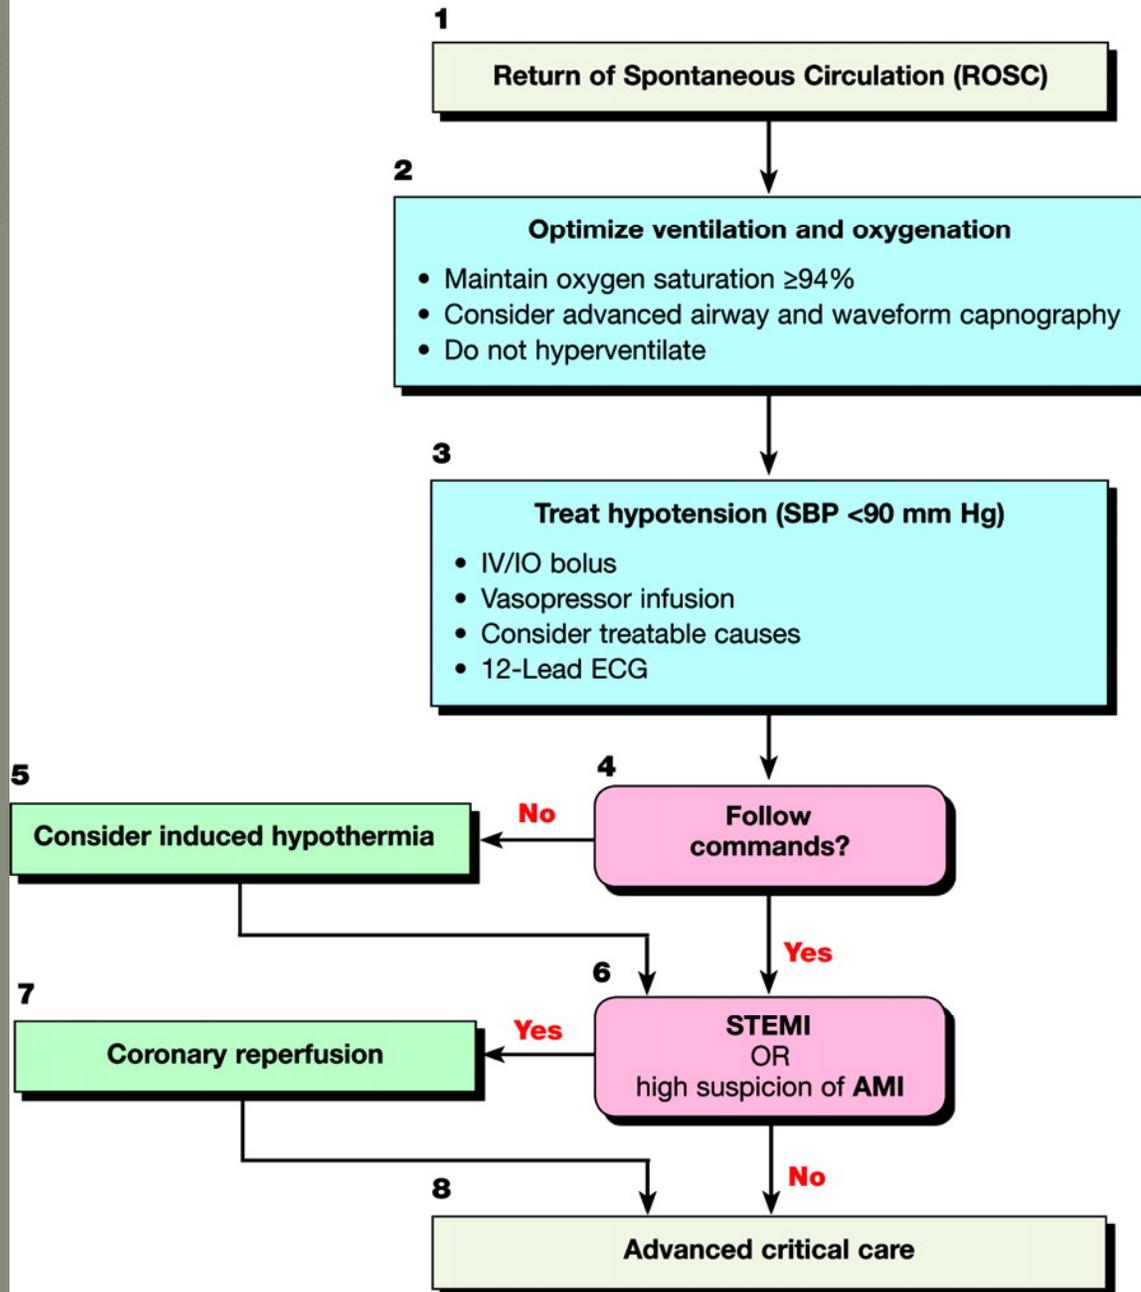

- What to do with the patient that comes back to life

# Pharmacology in the presence of a pulse

---

Mistakes may be more readily evident...

# Adult Immediate Post-Cardiac Arrest Care

## Doses/Details

### Ventilation/Oxygenation

Avoid excessive ventilation. Start at 10-12 breaths/min and titrate to target PETCO<sub>2</sub> of 35-40 mm Hg. When feasible, titrate FIO<sub>2</sub> to minimum necessary to achieve SpO<sub>2</sub> ≥94%.

### IV Bolus

1-2 L normal saline or lactated Ringer's. If inducing hypothermia, may use 4°C fluid.

### Epinephrine IV Infusion:

0.1-0.5 mcg/kg per minute (in 70-kg adult: 7-35 mcg per minute)

### Dopamine IV Infusion:

5-10 mcg/kg per minute

### Norepinephrine

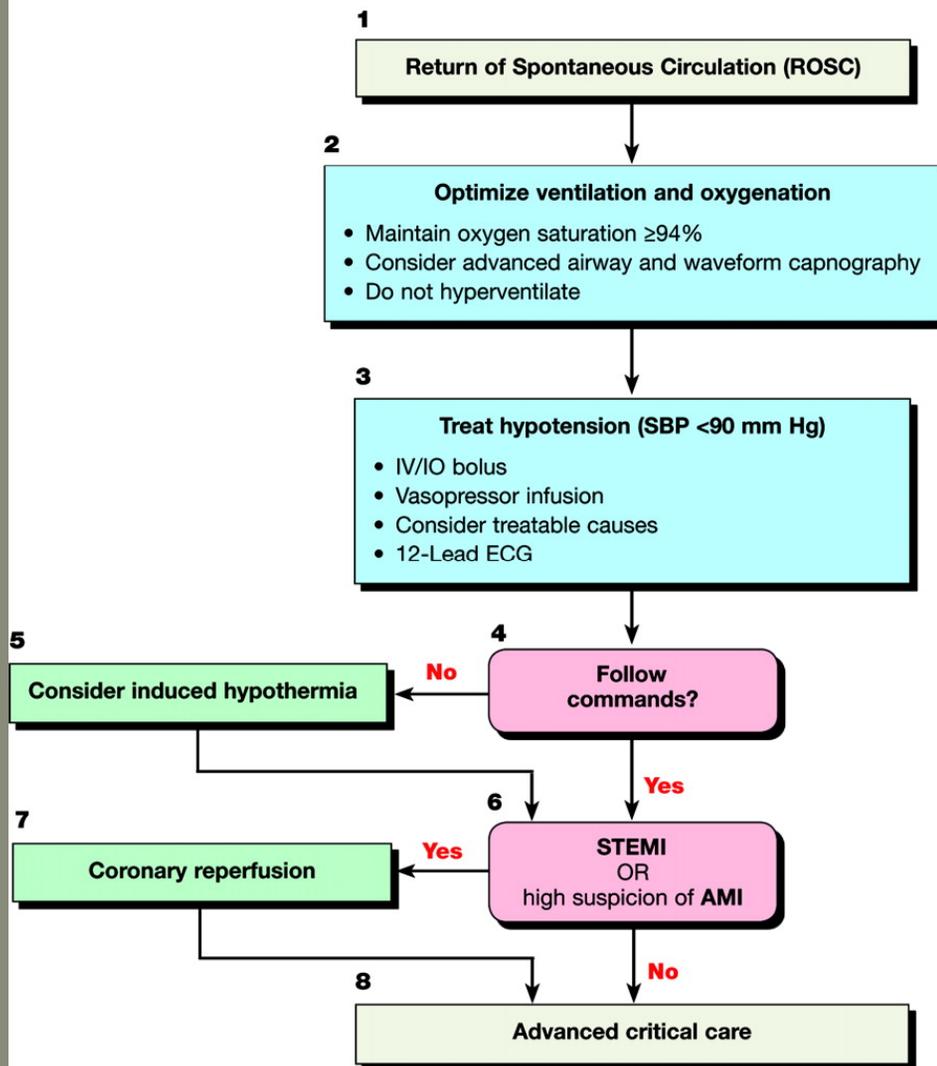

#### IV Infusion:

0.1-0.5 mcg/kg per minute (in 70-kg adult: 7-35 mcg per minute)

### Reversible Causes

- Hypovolemia
- Hypoxia
- Hydrogen ion (acidosis)
- Hypo-/hyperkalemia
- Hypothermia
- Tension pneumothorax
- Tamponade, cardiac
- Toxins
- Thrombosis, pulmonary
- Thrombosis, coronary

## Adult Immediate Post-Cardiac Arrest Care

### Doses/Details

#### Ventilation/Oxygenation

Avoid excessive ventilation. Start at 10-12 breaths/min and titrate to target  $P_{ET}CO_2$  of 35-40 mm Hg. When feasible, titrate  $FiO_2$  to minimum necessary to achieve  $SpO_2 \geq 94\%$ .

#### IV Bolus

1-2 L normal saline or lactated Ringer's. If inducing hypothermia, may use  $4^\circ C$  fluid.

#### Epinephrine IV Infusion:

0.1-0.5 mcg/kg per minute (in 70-kg adult: 7-35 mcg per minute)

#### Dopamine IV Infusion:

5-10 mcg/kg per minute

#### Norepinephrine

**IV Infusion:** 0.1-0.5 mcg/kg per minute (in 70-kg adult: 7-35 mcg per minute)

#### Reversible Causes

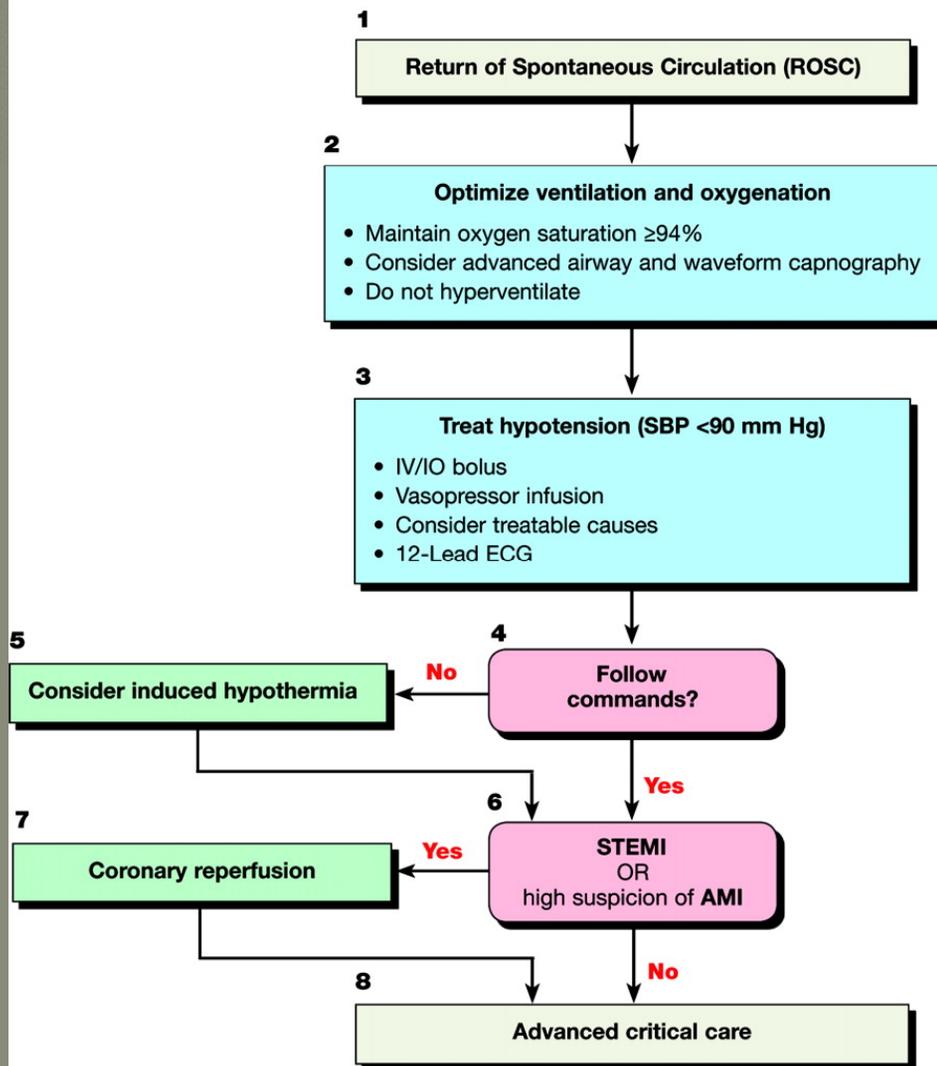

- Hypovolemia
- Hypoxia
- Hydrogen ion (acidosis)
- Hypo-/hyperkalemia
- Hypothermia
- Tension pneumothorax
- Tamponade, cardiac
- Toxins
- Thrombosis, pulmonary
- Thrombosis, coronary

We do this perfectly.

Always.

Right?

## Adult Immediate Post-Cardiac Arrest Care

### Doses/Details

#### Ventilation/Oxygenation

Avoid excessive ventilation. Start at 10-12 breaths/min and titrate to target  $P_{ET}CO_2$  of 35-40 mm Hg. When feasible, titrate  $FiO_2$  to minimum necessary to achieve  $SpO_2 \geq 94\%$ .

#### IV Bolus

1-2 L normal saline or lactated Ringer's. If inducing hypothermia, may use  $4^\circ C$  fluid.

- Toxins
- Thrombosis, pulmonary
- Thrombosis, coronary

Norepi? There's a rhyme about that stuff.

# Dopamine

---

- ◉ Natural catecholamine
- ◉ Positive chronotropic and inotropic effects

# Ino...chrono...dromo...tropes

---

## ● Inotrope

- in-ergy to get the job done

## ● Dromotrope

- Driving = Average Velocity

## ● Chronotrope

- Charging bulls run fast

# Dopamine

---

- Natural catecholamine
- Positive chronotropic and inotropic effects
- Dose Specificity
  - 0.5 – 2.0 – Low (aka renal dosing)
  - 2.0-10.0 – Intermediate
  - 10.0-20.0 - High

# Norepinephrine

---

- ◉ Alpha receptor agonist with inotropic tendency
  - Specificity can be a good thing
- ◉ Dose
  - 2-10 mcg/min
- ◉ May be seeing more of it shortly...
- ◉ Why the bad rep?

# ACS

---

“Half of the patients who die of ACS do so before reaching the hospital”

O'Connor et al. Part 10. *Circulation*. 2010;122(suppl 3):S789.

# “Changes” from 2010 update

---

- Return of the term *symptomatic*
- A nod to identifying the underlying issue
- Bradycardia
- Tachycardia

- Is Mona still greeting everyone?
  - She got cut back to part-time
- Oxygen
- ASA
- Nitrates
- Morphine (analgesia)

OANA isn't a good mnemonic...

# ACS Pharm

---

## Oxygen

- So why the change

- Studies
- Oxygen still there for the respiratory distress, heart failure, shock

- ASA

- Why?
- What if they took their own?

# ACS Pharm

---

- Nitrates

- Concerns?

- Pain management

- With?

- Beta-Blockers

# Bradycardia

# Bradycardia

## Identify and treat underlying cause

- Maintain patent airway; assist breathing as necessary
- Oxygen (if hypoxemic)
- Cardiac monitor to identify rhythm; monitor blood pressure and oximetry
- IV access
- 12-Lead ECG if available; don't delay therapy

## Persistent bradyarrhythmia causing:

- Hypotension?
- Acutely altered mental status?
- Signs of shock?
- Ischemic chest discomfort?
- Acute heart failure?

## Atropine

If atropine ineffective:

- Transcutaneous pacing  
OR
- **Dopamine** infusion  
OR
- **Epinephrine** infusion

# Bradycardia

## **Doses/Details**

### **Atropine IV Dose:**

First dose: 0.5 mg bolus

Repeat every 3-5 minutes

Maximum: 3 mg

### **Dopamine IV Infusion:**

2-10 mcg/kg per minute

### **Epinephrine IV Infusion:**

2-10 mcg per minute

# Bradycardia

---

## Atropine

- Anticholinergic  
OR
- Nonselective muscarinic  
acetylcholinergic antagonist

# Bradycardia

---

## Atropine

- Anticholinergic
- Nonselective muscarinic acetylcholinergic antagonist
  - Parasympathetic NS insurgence
    - Infiltration
    - Remove the command structure
    - Interruption of communications

# Bradycardia

---

## Atropine

- Any considerations prior to counter-insurgency?
- And what about the 'high blocks'?

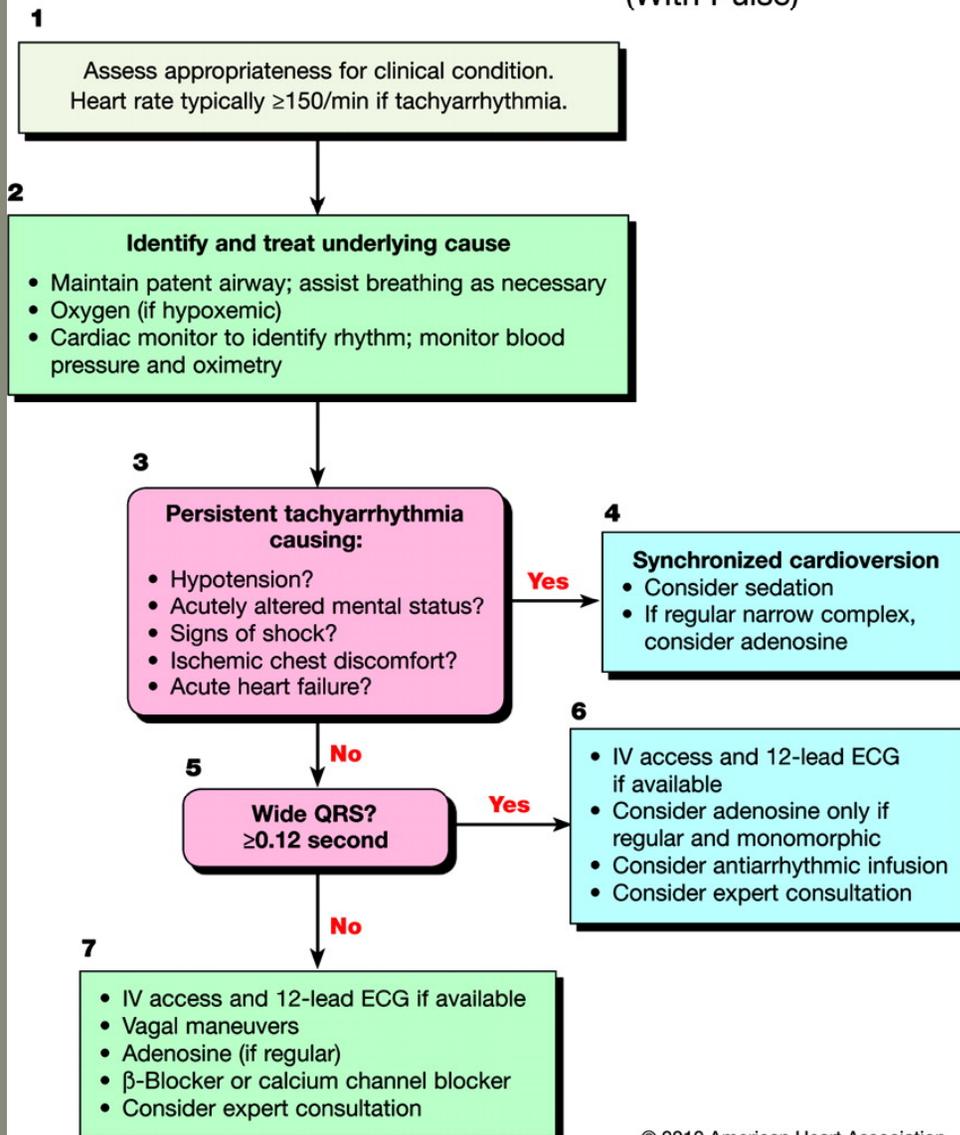

# Bradycardia

---

- Our common pressors haven't changed
- We're still using those a couple of the "tropes"
  - Inotrope
    - Epi
  - Chronotrope
    - Dopamine (epi too)

# Tachycardia

## Adult Tachycardia (With Pulse)

### Doses/Details

#### Synchronized Cardioversion

Initial recommended doses:

- Narrow regular: 50-100 J
- Narrow irregular: 120-200 J biphasic or 200 J monophasic
- Wide regular: 100 J
- Wide irregular: defibrillation dose (NOT synchronized)

#### Adenosine IV Dose:

First dose: 6 mg rapid IV push; follow with NS flush.

Second dose: 12 mg if required.

#### Antiarrhythmic Infusions for Stable Wide-QRS Tachycardia

##### Procainamide IV Dose:

20-50 mg/min until arrhythmia suppressed, hypotension ensues, QRS duration increases  $>50\%$ , or maximum dose 17 mg/kg given. Maintenance infusion: 1-4 mg/min. Avoid if prolonged QT or CHF.

##### Amiodarone IV Dose:

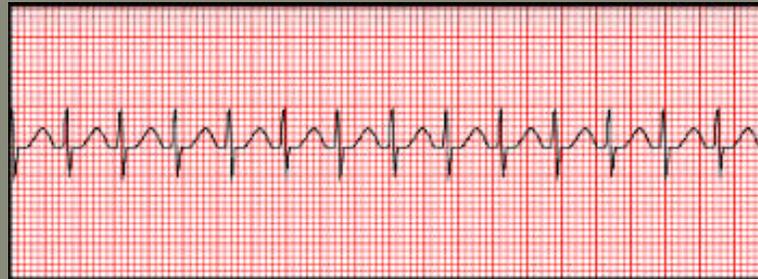

First dose: 150 mg over 10 minutes. Repeat as needed if VT recurs. Follow by maintenance infusion of 1 mg/min for first 6 hours.

##### Sotalol IV Dose:

100 mg (1.5 mg/kg) over 5 minutes. Avoid if prolonged QT.

The Good

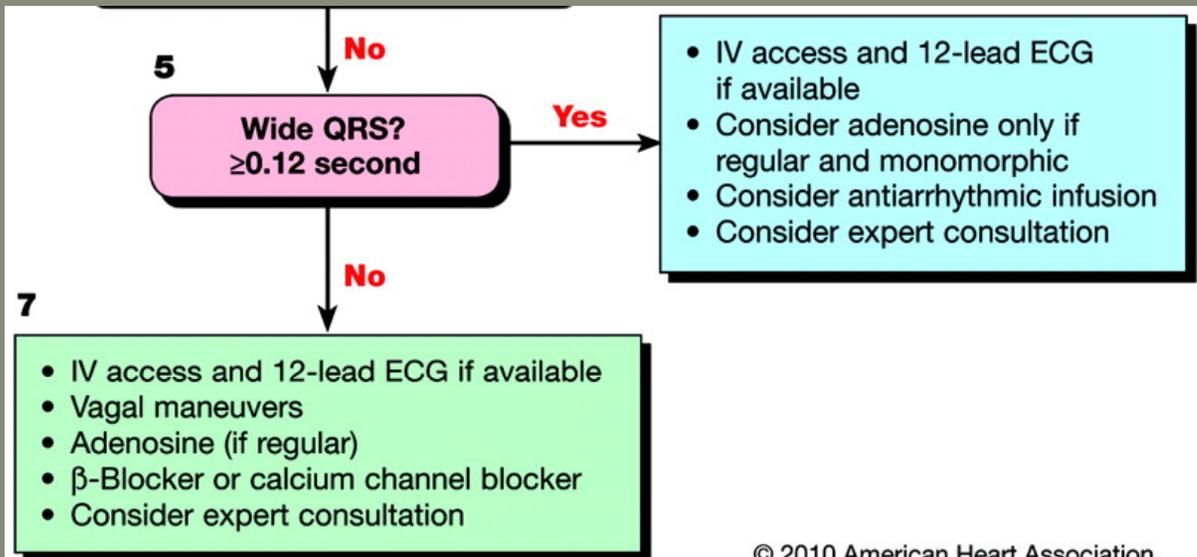

The Bad

The Ugly

# Adenosine

© 2010 American Heart Association

## Adenosine IV Dose:

First dose: 6 mg rapid IV push; follow with NS flush.

Second dose: 12 mg if required.

## Antiarrhythmic Infusions for Stable Wide-QRS Tachycardia

### Procainamide IV Dose:

20-50 mg/min until arrhythmia suppressed, hypotension ensues, QRS duration increases >50%, or maximum dose 17 mg/kg given. Maintenance infusion: 1-4 mg/min. Avoid if prolonged QT or CHF.

### Amiodarone IV Dose:

First dose: 150 mg over 10 minutes. Repeat as needed if VT recurs. Follow by maintenance infusion of 1 mg/min for first 6 hours.

### Sotalol IV Dose:

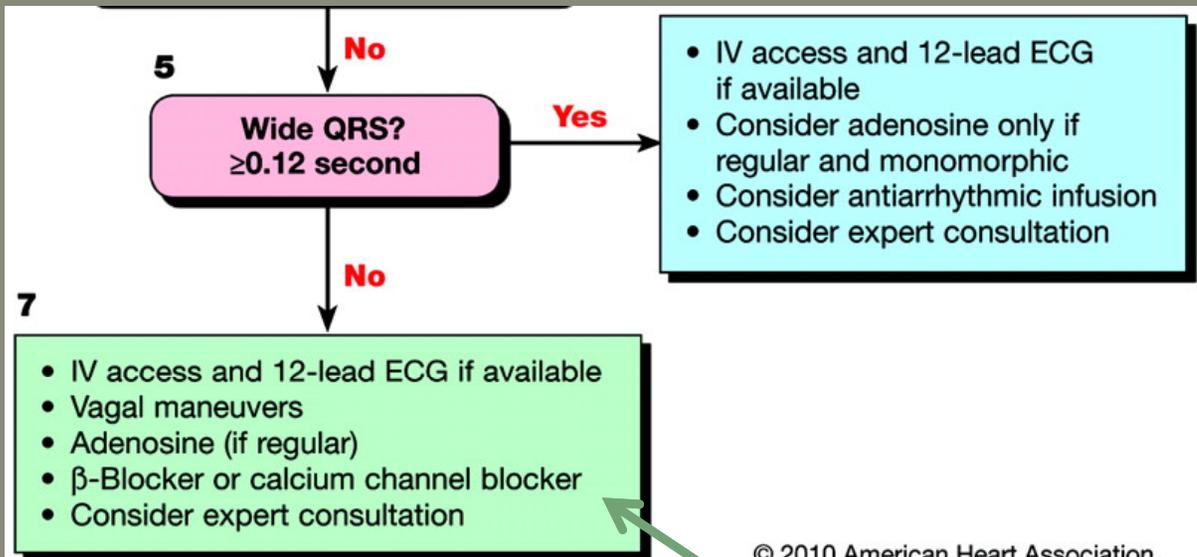

100 mg (1.5 mg/kg) over 5 minutes. Avoid if prolonged QT.

# Adenosine

---

- ◉ What is adenosine?
- ◉ MOA
- ◉ What limits its effect with atrial or ventricular dysrhythmias

# Blocking Beta and Ca<sup>+</sup> Channels

© 2010 American Heart Association

## Adenosine IV Dose:

First dose: 6 mg rapid IV push; follow with NS flush.

Second dose: 12 mg if required.

## Antiarrhythmic Infusions for Stable Wide-QRS Tachycardia

### Procainamide IV Dose:

20-50 mg/min until arrhythmia suppressed, hypotension ensues, QRS duration increases >50%, or maximum dose 17 mg/kg given. Maintenance infusion: 1-4 mg/min. Avoid if prolonged QT or CHF.

### Amiodarone IV Dose:

First dose: 150 mg over 10 minutes. Repeat as needed if VT recurs. Follow by maintenance infusion of 1 mg/min for first 6 hours.

### Sotalolol IV Dose:

100 mg (1.5 mg/kg) over 5 minutes. Avoid if prolonged QT.

# Blocking Beta and Ca<sup>+</sup> Channels

---

## ● Calcium Channels

- Produce Action Potential Plateau and modulate contraction strength
- In more depolarized regions (SA & AV) responsible for conduction and refraction

## ● Beta Receptor Antagonists

- Reduction of response
- Increased ERP

# Meds we know

---

- What we are used to
  - Amiodarone
  - Metoprolol or Diltiazem
- Procainamide?

# Procainamide

---

## ○ Effects

-  Atrial effective refractory period
-   A-V node function
-  Myocardial excitability – from atria to ventricle

## ○ Less desirable

-  Cardiac Output (undamaged)
-  CO (damaged)

## ○ Class 1a

# Procainamide

## ● ECG

- Sinus Tach
- Widened QRS
- Lengthened QT and PRI
- Decreased amplitude of QRS and T wave

***Antiarrhythmic Infusions for  
Stable Wide-QRS Tachycardia***

**Procainamide IV Dose:**

20-50 mg/min until arrhythmia suppressed, hypotension ensues, QRS duration increases >50%, or maximum dose 17 mg/kg given.  
Maintenance infusion: 1-4 mg/min.  
Avoid if prolonged QT or CHF.

# How about that Evidence

---

“There are three kinds of lies: lies, damned lies, and statistics”

- Mark Twain  
(attributed)

# Interestingly

---

- Arrest protocols from Richmond Ambulance Authority differ
- 2009-2012
  - Out of Hospital Cardiac Arrests: 765 (40% unwitnessed)
  - ROSC at Hospital: 206
    - That's 27% of patients included
    - Bystander CPR in 24%
  - National ROSC without bystander CPR: 15%

- Autopulse Usage

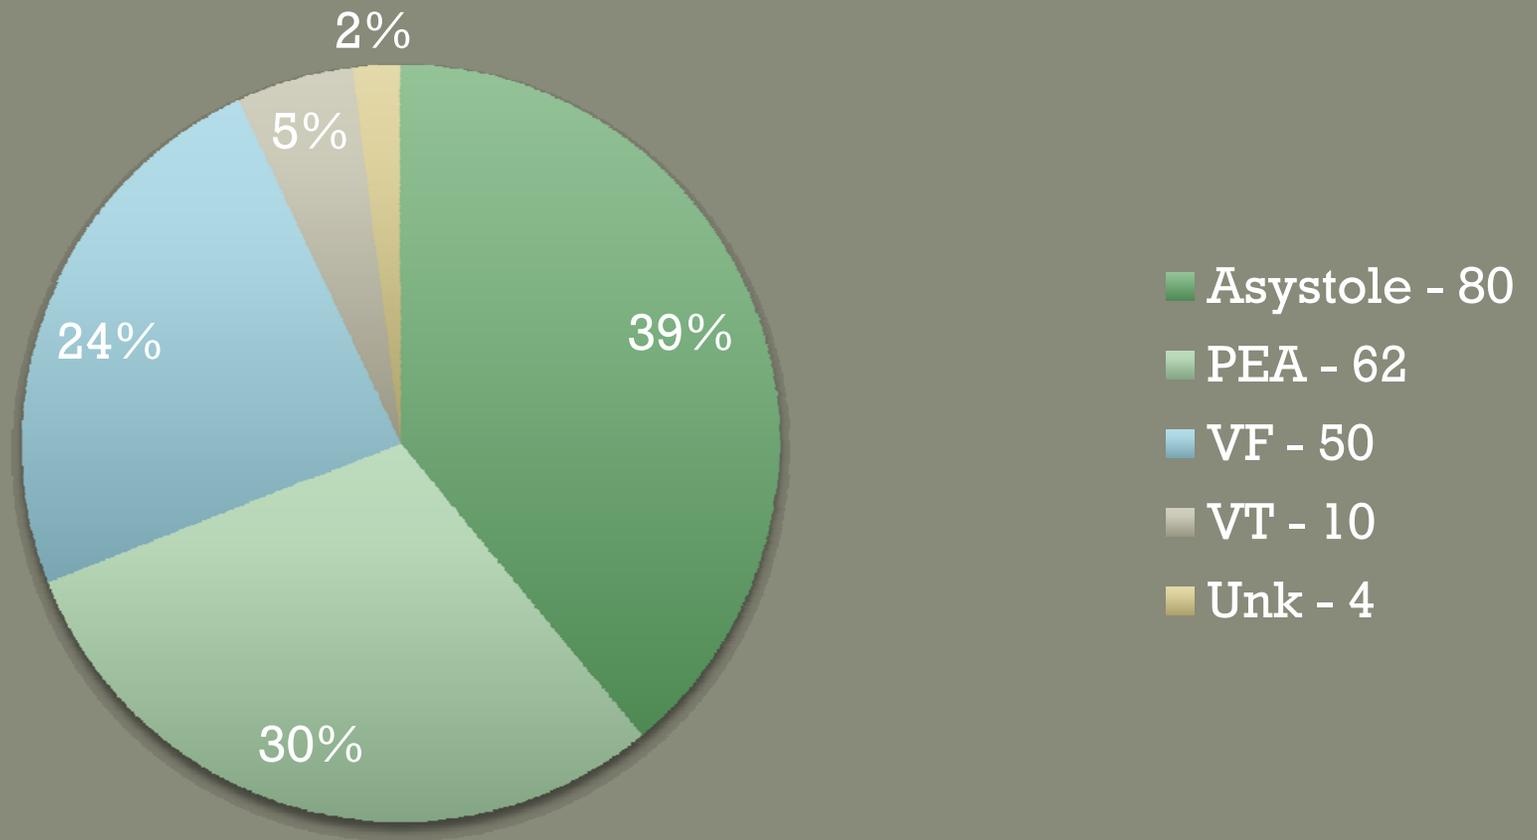

- 161 of the 206 with ROSC: 83% (failures excluded)

- Avg # of Epi doses per arrest – 1.6

- Avg # of Vaso doses per arrest – 1.5

# Stats

## Breakdown of ROSC by initial Rhythm

# What's different

---

- Autopulse CPR
- Vasopressin use
- Transport time
- Hypothermia starting in the field
  - In 2009, 52% of patients with ROSC and hypothermia started in the field survived to hospital discharge

**Questions, Concerns,  
Discussion?**

---
