

LEAD POISONING PREVENTION DURING PREGNANCY

Lead can be harmful for both the mother and the unborn baby. If the mother is exposed to lead during or before pregnancy, she can pass it on to her unborn baby in the womb. **Lead exposure during pregnancy can cause:**

Increased risk of stillbirth or miscarriage

Damage to the brain and nervous system

Low birth weight

FOLLOW THESE SIMPLE STEPS TO KEEP YOU AND YOUR BABY SAFE FROM LEAD EXPOSURE:

Wet-wipe and wet-mop floors, windowsills, and around home entrances

Attend all of your regular prenatal appointments

Eat a balanced and nutritious diet, full of iron, calcium, and vitamin C

Remove your shoes immediately after entering your home

Wash your hands often

Ask any family members that may be exposed to lead at work to change right after coming home

There are things you can do to protect yourself and your baby from the harmful impacts of lead exposure. Follow the tips below to reduce your risk of becoming exposed to lead:

- Avoid peeling, chipping paint
- Do not sand paint or remove paint with a heat gun
- Never sweep or dust with a dry cloth or broom
- Avoid remodeling your home while you are pregnant

Ask your doctor to give you a blood lead test if you are pregnant or trying to become pregnant, and may have been exposed to lead.
