

Would you like to participate in an antibody study for

COVID-19 ?

Researchers at George Mason University are evaluating technology to use saliva to test for COVID-19 antibodies. **COVID-19 antibodies provide very important information about the immune status of the patient (IRBNet number: 1592168-1).**

Measuring COVID-19 antibodies does not measure presence of the virus. It measures presence of antibodies that can fight COVID-19.

Researchers are evaluating the sensitivity and specificity of the following technologies for measuring COVID-19 antibodies:

- 1) A saliva collection oral swab,
- 2) A test that works as a pregnancy test that can be done on saliva at the point of care.

You may be eligible to participate if you meet the following criteria:

- Are willing to participate
- You think you have been exposed to COVID-19 in the past, or
- Your health care provider has informed you that you have a diagnosis of COVID-19

Your participation will be limited to providing a single saliva sample and optionally a single blood sample.

You will need to provide contact information of your health care provider, treating physician or student clinics. Results will be communicated to your health care provider.
