RABIES EXPOSURE DECISION TREE: HUMAN EXPOSED TO DOMESTIC ANIMAL

Exposure = any situation where saliva or central nervous system tissue of a confirmed or suspect rabid animal enters an open, fresh wound or comes in contact with a mucus membrane by entering the eye, nose or mouth. The most efficient route of exposure is a bite. **Dogs, cats and ferrets that bite people should be considered suspect rabid until the end of the 10 day observation period.**

*See guidelines for more details about rabies exposure
 ** PEP = postexposure prophylaxis
 § To determine which PEP series is necessary, ask the patient if s/he has received rabies vaccinations before.
