

# Diabetes and HHS: The Hyperosmotic Hyperglycemic Syndrome

*Charles S. Graffeo, MD*  
*Professor & Assistant Residency Director*  
*Department of Emergency Medicine*  
*Eastern Virginia Medical School*

# HHS...formerly known as

- v **Non-ketotic Hyperglycemic Coma**
- v **Hyperosmolar Hyperglycemic Non-ketotic Syndrome**
- v **Hyperosmotic Non-Ketotic State (HONK)**
- v **Hyperglycemic Hyperosmolar Syndrome**

# ***HHS: Why did ADA abandon...***

## **Non-ketotic Hyperglycemic Coma**

**Mental status changes  
23/122 (19%)**

# What to talk about ?

# *A pre pre-hospital talk...*

# So...

- ✓ **Epidemiology**
- ✓ **Thrifty Genes**
- ✓ **Macroeconomic issues**
- ✓ **Differences from DKA**
- ✓ **Who gets into trouble & why?**
- ✓ **Patient Assessment**
- ✓ **Approaches to management**

# Question...

**What are the 4 biggest risks associated with the development of Type 2 DM in the USA ?**

**1. & 2.**

**3. Genetic & Auto-Immune**

**4. The Farm Bill**

# At the root of the DM epidemic: The Farm Bill

- v **Founder of the Farm Bill**
- v ***Sec of Agriculture***
- v ***Assistance program to subsidize poor farmers***
- v ***\$284 Billion subsidy (2008)***  
***Mega-Farm industry***
- v ***Non-sustainable corn,soy & wheat farming practices***
- v ***Impact on the American diet***

Henry Wallace...(1888-1965)

# Agri-Farm Subsidies

| Rank | Program<br>(click for top recipients,<br>payment concentration<br>and regional rankings) | Number of<br>Recipients<br>1995-2006 | Subsidy Total<br>1995-2006 |

# So...how many calories will \$2.00 buy your patient's

## Subsidized crops

- ✓ 1100 Calories of cookies
- ✓ 1000 calories of chips
- ✓ 875 calories of soft drink
- ✓ 950 calories 39 ingredient Twinkie
- ✓ 1300 calories subsidized school lunch of chicken tenders and tater tots

## Non-Subsidized Crops

- ✓ 250 calories of carrots
- ✓ 322 calories avocado
- ✓ 170 calories of OJ
- ✓ 100 calories tomatoes
- ✓ 165 calories of almonds

# King Corn...

*"When meditating over a disease, I never think of finding a remedy for it, but, instead a means of preventing it."* L. Pasteur 1884

- ✓ #1 crop 93 million acres
- ✓ 9.4 Billion corn subsidy
- ✓ HF corn syrup #1
- ✓ Obesity ages 6-11
- ✓ Feedlot Obesity
- ✓ Cost of food

# Epidemiology of Diabetes

Type 1: 5 -10%

Type 2 : 90 - 95%

African Americans: 1.7 > than Caucasian

Poor twice that of the Affluent

Prevalence is nearly doubling every decade in developed countries.

# Prevalence by age

Estimated number of new cases of diagnosed diabetes in people aged 20 years or older, by age group, United States, 2007

CDC. National Diabetes Fact Sheet, 2007.

Source: 2004–2006 National Health Interview Survey estimates projected to year 2007.

## Rate of new cases of type 1 and type 2 diabetes among youth aged <20 years, by race/ethnicity, 2002–2003

CDC. National Diabetes Fact Sheet, 2007.

NHW=Non-Hispanic whites; AA=African Americans; H=Hispanics; API=Asians/Pacific Islanders; AI=American Indians

# Diabetes Mellitus: A “Thrifty” Genotype Rendered Detrimental by “Progress”?

JAMES V. NEEL

*Department of Human Genetics,  
University of Michigan Medical School,  
Ann Arbor, Mich.*

FOR THE POPULATION GENETICIST, diabetes mellitus has long presented an enigma. Here is a relatively frequent disease, often interfering with reproduction by virtue of an onset during the reproductive or even pre-reproductive years, with a well-defined genetic basis, perhaps as simple in many families as a single recessive or incompletely recessive gene (cf. Allan, 1933; Pincus and White, 1933, 1934; Harris, 1950; Steinberg and Wilder, 1952; Lamy, Frézal and de Grouchy, 1957; Steinberg, 1959; Post, 1962a). If the considerable frequency of the disease is of relatively long duration in the history of our species, how can this be accounted for in the face of the obvious and strong genetic selection against the condition? If, on the other hand, this frequency is a relatively recent phenomenon, what changes in the environment are responsible for the increase? Current developments in the study of this disease suggest an explanation with important biological ramifications.

**“THRIFTINESS” OF DIABETIC GENOTYPE PRIOR TO ONSET OF  
DIABETES MELLITUS**

# Prevalence by ethnicity/economics

## “thrifty gene theory”

Estimated age-adjusted total prevalence of diabetes  
in people aged 20 years or older, by race/ethnicity—  
United States, 2005

Source: For American Indians/Alaska Natives, the estimate of total prevalence was calculated using the estimate of diagnosed diabetes from the 2003 outpatient database of the Indian Health Service and the estimate of undiagnosed diabetes from the 1999–2002 National Health and Nutrition Examination Survey. For the other groups, 1999–2002 NHANES estimates of total prevalence (both diagnosed and undiagnosed diabetes) were projected to year 2005.

# Pima Indians: A lesson in Population Genetics

# Impact on Pima Society

nents

ry

# Diabetes in Kids

- ✓ one quarter to one third of children and teens are now overweight
- ✓ 8- to 10-year-olds represent the fastest-growing group of overweight and obese children
- ✓ Strong family history of diabetes with 45-80% have at least one parent with diabetes
- ✓ Typically from AA, Hispanic, PI, & Native Americans
- ✓ About 90% of children with type 2 have dark shiny patches on the skin
- ✓ Association with polycystic ovary syndrome (PCOS)

# Acanthosis Nigricans

# ***Back to....The DISEASE***

***“ HHS and DKA should be viewed as a similar disease process with the fundamental difference being in the metabolism of lipids during a period of relative insulin deficiency.”***

# *Remember the fundamentals*

## Type 1 DM

*a cell mediated  
autoimmune or other  
destructive process  
of the pancreatic b-  
islet cells resulting in  
an **absolute**  
**deficiency** of insulin*

## Type 2 DM

***insulin resistance**  
in a milieu of normal or  
increased levels of  
circulating insulin*

*Avoid: “IDDM & NIDDM”*

# Diabetes Variants

*(Is there an endocrinologist in the room?)*

- v **Maturity Onset Diabetes (MODY)**
  - 6 genetic variants
- v **Late-onset Autoimmune Diabetes of Adulthood (LADA)**
  - aka Slow Onset Type 1 diabetes
  - Type 1.5 diabetes.

# **LADA: DM Type 1.5**

- ✓ **Often misdiagnosed as type 2**
- ✓ **Unlikely to run in family**
- ✓ **Non insulin resistance**
- ✓ **Insulin preferred to orals**
- ✓ **Positive AB's that attack B-cells**  
**GAD 65 (glutamic acid decarboxylase)**

# **MODY: Maturity Onset Diabetes of Youth**

- ✓ May make up as many as 5% of presumed type 1 and type 2 diabetes
- ✓ Time of onset 65% by age 25 100% by age 50
- ✓ Commonly expressed @ gestation
- ✓ Due to ineffective insulin production or release due to a gene mutation
- ✓ Autosomal dominant with FH of DM
- ✓ 6 different genotypes described
- ✓ Usually less resistance to glycemic control requiring smaller insulin doses

# The long list...

- I. Type 1 diabetes ( $\beta$ -cell destruction, usually leading to absolute insulin deficiency)
  - A. Immune mediated
  - B. Idiopathic
- II. Type 2 diabetes (may range from predominantly insulin resistance with relative insulin deficiency to a predominantly secretory defect with insulin resistance)
- III. Other specific types
  - A. Genetic defects of  $\beta$ -cell function
    - 1. Chromosome 12, HNF-1 $\alpha$  (MODY3)
    - 2. Chromosome 7, glucokinase (MODY2)
    - 3. Chromosome 20, HNF-4 $\alpha$  (MODY1)
    - 4. Chromosome 13, insulin promoter factor-1 (IPF-1; MODY4)
    - 5. Chromosome 17, HNF-1 $\beta$  (MODY5)
    - 6. Chromosome 2, *NeuroDI* (MODY6)
    - 7. Mitochondrial DNA
    - 8. Others
  - B. Genetic defects in insulin action
    - 1. Type A insulin resistance
    - 2. Leprechaunism
    - 3. Rabson-Mendenhall syndrome
    - 4. Lipotrophic diabetes
    - 5. Others
  - C. Diseases of the exocrine pancreas
    - 1. Pancreatitis
    - 2. Trauma/pancreatectomy
    - 3. Neoplasia
    - 4. Cystic fibrosis
    - 5. Hemochromatosis
    - 6. Fibrocalculous pancreatopathy
    - 7. Others
  - D. Endocrinopathies
    - 1. Acromegaly
    - 2. Cushing's syndrome
    - 3. Glucagonoma
    - 4. Pheochromocytoma
    - 5. Hyperthyroidism
    - 6. Somatostatinoma
    - 7. Aldosteronoma
    - 8. Others
  - E. Drug- or chemical-induced
    - 1. Vacor
    - 2. Pentamidine
    - 3. Nicotinic acid
    - 4. Glucocorticoids
    - 5. Thyroid hormone
    - 6. Diazoxide
    - 7.  $\beta$ -adrenergic agonists
    - 8. Thiazides
    - 9. Dilantin
    - 10.  $\alpha$ -Interferon
    - 11. Others
  - F. Infections
    - 1. Congenital rubella
    - 2. Cytomegalovirus
    - 3. Others
  - G. Uncommon forms of immune-mediated diabetes
    - 1. "Stiff-man" syndrome
    - 2. Anti-insulin receptor antibodies
    - 3. Others
  - H. Other genetic syndromes sometimes associated with diabetes
    - 1. Down's syndrome
    - 2. Klinefelter's syndrome
    - 3. Turner's syndrome
    - 4. Wolfram's syndrome
    - 5. Friedreich's ataxia
    - 6. Huntington's chorea
    - 7. Laurence-Moon-Biedl syndrome
    - 8. Myotonic dystrophy
    - 9. Porphyria
    - 10. Prader-Willi syndrome
    - 11. Others
- IV. Gestational diabetes mellitus (GDM)

# *The ADA*

## *So...who's a diabetic?*

FPG  $\geq 126$  mg/dl (7.0 mmol/l). Fasting is defined as no caloric intake for at least 8 h.\*

OR

Symptoms of hyperglycemia and a casual plasma glucose  $\geq 200$  mg/dl (11.1 mmol/l). Casual is defined as any time of day without regard to time since last meal. The classic symptoms of hyperglycemia include polyuria, polydipsia, and unexplained weight loss.

OR

2-h plasma glucose  $\geq 200$  mg/dl (11.1 mmol/l) during an OGTT. The test should be performed as described by the World Health Organization, using a glucose load containing the equivalent of 75 g anhydrous glucose dissolved in water.\*

# Who's *almost* a diabetic: Glucose Intolerance

- ✓ Pre-dates onset of DM often by years
- ✓ Clinically inapparent
- ✓ Random glucose  $>160$  mg/dl
- ✓ Fasting  $> 110$  or  $<126$  mg/dl
- ✓ Estimated 13.5 million Americans
- ✓ Average time to diagnosis of DM?

# *Who should be screened...*

- v Age > 45 then q 3 yrs
- v BMI > 25 plus
  - First-degree relatives
  - Non-caucasian
  - Couch potatoes
  - Women with GDM or big babies
  - HTN & lipids
  - <20 y/o acct. for 45% of all new cases of DM

Table 4—Testing for type 2 diabetes in asymptomatic children

---

Criteria

- Overweight (BMI >85th percentile for age and sex, weight for height >85th percentile, or weight >120% of ideal for height)

Plus any two of the following risk factors:

- Family history of type 2 diabetes in first- or second-degree relative
- Race/ethnicity (e.g., Native American, African American, Latino, Asian American, and Pacific Islander)
- Signs of insulin resistance or conditions associated with insulin resistance (e.g., acanthosis nigricans, hypertension, dyslipidemia, or PCOS)
- Maternal history of diabetes or GDM

Age of initiation: age 10 years or at onset of puberty, if puberty occurs at a younger age

Frequency: every 2 years

Test: FPG preferred

---

# Clinical Scenario

- ✓ 77 y/o recent NHP recent d/c from hospital with CVA and right hemiparesis. EMS called to scene for AMS. On arrival patient is noted to be arousable but lethargic
- ✓ Patient c/c weak all over, “tired”
- ✓ PMHX: HTN, CVA, COPD, mild dementia
- ✓ Temp: Warm, P:54, R 50 BP 90/60
- ✓ Exam: dry MM, COR:S1S2, Lungs: CTA, Abd: Soft, mild suprapubic tenderness,
- ✓ LABS: Accucheck HHH
- ✓ Concerns?

# *QUESTIONS*

*What are your major concerns?*

*How did this little old lady  
get into trouble?*

# *QUESTION*

Why isn't HHS presenting as a more  
common complaint among the  
16 million **un-diagnosed**  
Type 2 diabetics ?

# Access to...H<sub>2</sub>O

*So who gets sick ?*

# So who gets HHS ?

## ELDERLY & INCAPACITATED

- ✓ Who need others to gain access to H2O
- ✓ Who are unlikely to self refer
- ✓ Who typically feel bad much of the time anyway
- ✓ Who are on multi-pharmacy
- ✓ Have significant co-morbidities

# So what happens in HHS...?

- ✓ **An inciting event**
- ✓ **A reduction in response to insulin**
- ✓ **An elevation of counter-regulatory “stress” hormones**  
(glucagon, catecholamines, cortisol, and GH)
- ✓ **An osmotic diuresis with  $>GFR$**
- ✓ **Dehydration and  $< GFR$**

# In other words...

# Essential differences:

|                                              | DKA       |           | Severe      | HHS         |
|----------------------------------------------|-----------|-----------|-------------|-------------|
|                                              | Mild      | Moderate  |             |             |
| Plasma glucose (mg/dl)                       | >250      | >250      | >250        | >600        |
| Arterial pH                                  | 7.25–7.30 | 7.00–7.2  | <7.00       | >7.30       |
| Serum bicarbonate (mEq/l)                    | 15–18     | 10 to <1  | <10         | >15         |
| Urine ketones*                               | Positive  | Positive  | Positive    | Small       |
| Serum ketones*                               | Positive  | Positive  | Positive    | Small       |
| Effective serum osmolality (mOsm/kg)†        | Variable  | Variable  | Variable    | >320        |
| Anion gap‡                                   | >10       | >12       | >12         | Variable    |
| Alteration in sensoria or mental obtundation | Alert     | Alert/dro | Stupor/coma | Stupor/coma |

\*Nitroprusside reaction method; †calculation:  $2[\text{measured Na (mEq/l)} - (\text{Cl}^- + \text{HCO}_3^-) \text{ (mEq/l)}]$ . See text for details.

# Relative mortality

DKA -> 2.5 - 10%

HHS -> 20 - 50%

# **Pinnes et.al.** (Diab care 2006)

## **Described 132 pts. HHS**

- ✓ **Mean age 75**
- ✓ **84% precipitating factor**
- ✓ **100% dehydration**
- ✓ **8% had coma**
- ✓ **Mean glucose 407**
- ✓ **Mean Osm 380**
- ✓ **Mortality 20%**

# What else predisposes to HHS?

- ✓ **Infection #1**
- ✓ **UTI**
- ✓ **Pneumonia**
- ✓ **Uremia**
- ✓ **Glucose intolerant**
- ✓ **Parenteral nutrition**
- ✓ **Pancreatitis**
- ✓ **Heat related illness**
- ✓ **MI**
- ✓ **CVA**
- ✓ **Rhabdomyolysis**
- ✓ **Mesenteric ischemia**
- ✓ **GI bleed**
- ✓ **Burns**
- ✓ **Peritoneal dialysis**

# Drugs: *Which are the two worst*

- ✓ **Diuretics**
- ✓ **β-blockers**
- ✓ **Steroids**
- ✓ **Neuroleptics**
- ✓ **Benzo's**
- ✓ **Lithium**
- ✓ **Mannitol**
- ✓ **Dilantin**
- ✓ **Statins**
- ✓ **Ace Inhib.**

# Drugs & HHS

- ✓ **Diuretics**
- ✓ **β-blockers**
- ✓ **Steroids**
- ✓ **Neuroleptics**
- ✓ **Benzo's**
- ✓ **Lithium**
- ✓ **Mannitol**
- ✓ **Dilantin**
- ✓ **Statins**
- ✓ **Ace Inhib.**

# *Despite the etiology...remember*

***“ HHS and DKA should be viewed as a similar disease process with the fundamental difference being in the metabolism of lipids during a period of relative insulin deficiency.”***

# Typical Pre-hospital history

NHP 1 week after lab draw “WOW...check out these labs”

✓ Change in mental status

✓ Acute febrile illness

✓ New onset seizure

Hypotension

✓ Acute CVA

# The Exam

- ✓ Subtle changes in MS
- ✓ Search for precipitating problem
- ✓ Signs of profound dehydration
- ✓ 15% new onset seizure (focal)
- ✓ Hypothermia poorly prognostic
- ✓ Far along in the NH of disease

# Approach to treatment...

# Fundamentals of Treatment

- ✓ **Correct hypovolemia first**
- ✓ **Rapid identification of precipitating causes**
- ✓ **Identify septic patient quickly**
- ✓ **Correct electrolyte abnormalities**
- ✓ **Antibiotics where indicated**
- ✓ **Strict attention to preexisting illness**
- ✓ **Avoid overzealous resuscitation**
- ✓ **Insulin therapy**

# Fluids....

Hydrate for first hour

Initial 0.9% NaCl 1-2 L

then 0.45% NaCl (eu or hypernatremic)

then D5 .45% NaCl (250-300mg/dl)

then PO

*1/2 fluid deficit should be replaced first 12 hrs with remainder over subseq 24 hrs.*

# What can go *really* wrong?

## Cerebral Edema

- ✓ **First described in 1933 (Dillon, Riggs & Dyer)**
- ✓ Accounts for 70% of deaths in DKA in young patients
- ✓ **Very rare in adults**
- ✓ **Early identification and frequent reassessments are critical**
- ✓ **Some studies demonstrate edema prior to initiation of treatment**
- ✓ **Sub-clinical cerebral edema may occur prior to institution of treatment**
- ✓ **48 hr rehydration vs. 24 hr may offer theoretical protection**

# Complications

- ✓ CHF
- ✓ KCl derangements
- ✓ Cerebral Edema
- ✓ Failure to diagnose
- ✓ Hypoglycemia
- ✓ Early Consults

# In Summary

- ✓ **Avoid getting hung up on “type 1 or type 2”**
- ✓ **Early identification of precipitating problem**
- ✓ **Identify meds that could be contributing**
- ✓ **Avoid overzealous resuscitation**
- ✓ **Frequent serial exams assessing cognition**
- ✓ **Anticipate role of co-morbid issues**
- ✓ **Remember sepsis**
- ✓ **Appropriate Goal Directed Therapy**

**Thanks!**
