What does the current geographic spread of influenza look like?

Geographic Activity Level by Week, Last Two Flu Seasons

During the week ending on July 30, 2022 (week 30), Virginia was at the **Local** level.

During the 2021-22 flu season, Virginia has spent **11** weeks at Widespread.

Activity Levels are determined as follows

- **No Activity** - No ILI, outbreak, or lab activity above threshold
- **Sporadic** - One confirmed outbreak or lab activity without elevated ILI
- **Local** - Lab activity with either elevated ILI or more than one outbreak in one region
- **Regional** - Lab activity with either elevated ILI or more than one outbreak in two regions
- **Widespread** - Lab activity with either elevated ILI or more than one outbreak in three or more regions

For more details on the data and methods used in this report, please see the Additional Information tab.
How many people are seeking care for an influenza-like illness (ILI)?

During the week ending July 30, 2022 (week 30), Virginia reported 2.1% of ED and UCC visits were for ILI.

During the week ending July 30, 2022, the highest ILI intensity level observed in any region was 1 (Minimal).

For more details on the data and methods used in this report, please see the Additional Information tab.
Who is seeking care for an influenza-like illness (ILI)?

Percent of Visits for Influenza-like Illness by Region, 2021-22 Flu Season

Flu Season
2021-22

Region
Central
Eastern
Northern
Northwest
Southwest

During the week ending July 30, 2022 (week 30), there were 1 regions above threshold for ILI visits.

The largest proportion of visits by age group for ILI during the week ending July 30, 2022 (week 30) was observed in the 0-4 years age group with 8.9% of total visits.

For more details on the data and methods used in this report, please see the Additional Information tab.
What influenza strains are circulating?

Confirmatory Laboratory Reports by Week and Subtype, 2021-22 Flu Season

Virginia received 25 positive confirmatory lab reports during the week ending July 30, 2022 (week 30).

There have been 4,690 infections in Virginia during the 2021-22 flu season to date, meaning that a predominant strain cannot be identified.

For more details on the data and methods used in this report, please see the Additional Information tab.
There have been no suspected or confirmed outbreaks to date during the 2018-19 flu season.

Virginia investigated 0 influenza outbreaks during the week ending July 30, 2022 (week 30).

Virginia investigated a total of 24 outbreaks during the 2021-22 flu season.

For more details on the data and methods used in this report, please see the Additional Information tab.
Virginia Department of Health
Weekly Influenza Activity Report

How many people have died with influenza?

VDH has reported **1** influenza-associated pediatric death during the 2021-22 flu season.

VDH has received report of **3,513** pneumonia, influenza, and/or COVID-19-associated deaths during the 2021-22 flu season.

For more details on the data and methods used in this report, please see the Additional Information tab.
What are the main points about influenza activity in Virginia right now?

During the week ending on July 30, 2022 (week 30), Virginia was at the Local level.

During the 2021-22 flu season, Virginia has spent 11 weeks at Widespread. During the week ending July 30, 2022 (week 30), Virginia reported 2.1% of ED and UCC visits were for ILI.

During the week ending July 30, 2022, the highest ILI intensity level observed in any region was 1 (Minimal).

During the week ending July 30, 2022 (week 30), there were 1 regions above threshold for ILI visits.

The largest proportion of visits by age group for ILI during the week ending July 30, 2022 (week 30) was observed in the 0-4 years age group with 8.9% of total visits.

Virginia received 25 positive confirmatory lab reports during the week ending July 30, 2022 (week 30).

There have been 4,690 infections in Virginia during the 2021-22 flu season to date, meaning that a predominant strain cannot be identified.

Virginia investigated 0 influenza outbreaks during the week ending July 30, 2022 (week 30).

Virginia investigated a total of 24 outbreaks during the 2021-22 flu season. VDH has reported 1 influenza-associated pediatric death during the 2021-22 flu season.

VDH has received report of 3,513 pneumonia, influenza, and/or COVID-19-associated deaths during the 2021-22 flu season.

For more details on the data and methods used in this report, please see the Additional Information tab.
Where do these data and methods come from? What are their limitations?

Geographic Spread Activity Level
Geographic spread is calculated using the percent of visits for ILI, the number of laboratory confirmed cases of influenza, and the number of confirmed or suspected outbreaks per region according to guidance from the Centers for Disease Control and Prevention (CDC). This measure provides a snapshot of how much of Virginia is affected by influenza at any given time, but does not reflect intensity or severity.

Emergency Department (ED) and Urgent Care Center (UCC) Visits for Influenza-like Illness (ILI)
VDH receives data on ED and urgent care visits from 154 facilities throughout Virginia as part of the syndromic surveillance program. Each visit’s chief complaint, or patient-stated reason for seeking medical care, is analyzed using a syndrome definition for ILI (fever with cough or fever with sore throat). These data are presented as a percentage of total ED and urgent care visits in order to adjust for increased reporting over time. Baseline is calculated by averaging the percent of visits for ILI during non-flu weeks and is determined using CDC methodology. A threshold is calculated for each region in Virginia as baseline plus two standard deviations.

Confirmatory Laboratory Results
Reverse transcription polymerase chain reaction (RT-PCR), viral culture, and direct fluorescent antibody (DFA) test results are considered confirmatory for influenza. Some medical providers are able to offer these tests at in-house laboratories, some send samples to commercial laboratories, and some have partnered with the Virginia public health laboratory, the Division of Consolidated Laboratory Services (DCLS) to have select specimens tested. In Virginia, if confirmatory lab results are available, they are required to be reported to VDH. These data provide details on the specific strains and subtypes circulating each year for situational awareness, future vaccine strain selection, and potential pandemic preparedness.

Suspected and Confirmed Outbreaks
In Virginia, all outbreaks are required to be reported to the local health department. Local and regional epidemiologists respond to reported outbreaks by collecting data and providing infection control recommendations. Influenza outbreaks are considered suspected if the symptoms, onset dates, and general presentation matches the flu and can be confirmed with the presence of at least one positive flu test - either one of the confirmatory test types mentioned above or a commercially-available rapid test.

Influenza-Associated Pediatric Deaths
In 2004, the CDC made influenza-associated pediatric mortality a nationally-notifiable condition. VDH acts as the reporting agency by investigating, collecting, and providing data on each case including virus subtype, vaccination history, and any viral or bacterial coinfections. Only the child’s age group and geographic region are reported to the public in order to maintain privacy and sensitivity.

Pneumonia, Influenza, and COVID-19 (PIC) Deaths
Due to the ongoing COVID-19 pandemic, VDH has changed the way pneumonia and influenza (P&I) deaths are aggregated. For more information on why VDH made this change, please visit https://www.vdh.virginia.gov/epidemiology/influenza-flu-in-virginia/influenza-surveillance/.

The VDH Office of Vital Records collects and maintains death certificates on all Virginia residents. These records are sent to the National Center for Health Statistics (NCHS) for cause-of-death coding. VDH receives these records back in the weeks and months that follow with associated ICD-10 codes for each contributing cause of death. There can be multiple ICD-10 codes listed for each death.

Prior to the COVID-19 pandemic, these coded records were used each flu season to calculate the number of deaths that occurred on a weekly basis in Virginia due to pneumonia and influenza (P&I). Now, VDH is following the CDC standard of adding COVID-19 coded deaths to P&I to create the PIC (pneumonia, influenza, and/or COVID-19) classification. PIC includes all deaths with pneumonia, influenza, and/or COVID-19 listed on the death certificate. Detailed information about this classification can be found at the CDC’s Influenza Surveillance System page, located here.
